

GUIDE TO WEED CONTROL

2008 - 2009

Publication 75

Discard old editions of this publication. Each year the appropriate sub-committee of the Ontario Pest Management Research and Services Committee reviews the pesticides listed in this publication. To the best knowledge of the committee, at the time of printing, the pesticide products listed in this publication were:

- federally registered
- classified by the Ministry of the Environment.

The information in this publication is general information only. The Ministry of Agriculture, Food and Rural Affairs does not offer any warranty or guarantee, nor does it assume any liability for any crop loss, animal loss, health, safety or environmental hazard caused by the use of a pesticide mentioned in this publication.

This publication lists a number of brand names of pesticides. It is neither an endorsement of the product nor a suggestion that similar products are ineffective.

The Pesticide Label

Consult each product label before you use a pesticide. The label provides specific information on how to use the product safely, hazards, restrictions on use, compatibility with other products, the effect of environmental conditions, etc.

The pesticide product label is a legal document. It is against the law to use the product in any other way.

Federal Registration of Pesticide Products

The Pest Management Regulatory Agency (PMRA) of Health Canada registers pesticide products for use in Canada based on following an evaluation of

scientific data to ensure that the product has merit and value; and the human health and environmental risks associated with its proposed use are acceptable.

1. Full Registration

Pesticide registrations are normally granted for a period of five years, subject to renewal.

2. Temporary Registration

Temporary registration may be granted for a period not to exceed one year, where the registrant agrees to produce additional scientific or technical information, or the pesticide is used for emergency control of a serious pest outbreak.

Maximum Residue Limits

Health Canada has established maximum residue limits (MRLs) for pesticides. Processors or retailers may demand more restrictive limits. Growers should seek advice of their intended market to determine if more restrictive limitations apply. Keep accurate and up-to-date records on pesticide use in each crop.

Supplemental Labels

You **MUST** obtain a supplemental label and follow all the label directions when PMRA approves new uses for a registered pesticide that do not appear on the current label.

Examples of when you must use a supplemental label include:

- Temporary Registrations for Emergency Use
- Minor Use Label Expansion

You can obtain a copy of a supplemental label from the pesticide manufacturer or pesticide vendor, the grower association that sponsored the emergency registration or minor use, from OMAFRA or PMRA's Pest Management Information Service.

For more information on the federal registration status check the PMRA website at www.hc-sc.gc.ca/pmra-arla or call 1-800-267-6315.

Regulation of Pesticides in Ontario

The Ministry of the Environment is responsible for regulating pesticide sale, use, transportation, storage and disposal in Ontario. Ontario regulates pesticides by placing appropriate education, licensing and/or permit requirements on their use, under the *Pesticides Act* and Regulation 914.

All Pesticides must be used in accordance with requirements under the *Pesticides Act* and Regulation 914. The act and Regulation are available on the e-laws website at www.e-laws.gov.on.ca or call Publications Ontario Toll-Free number: 1-800-668-9938 or 416-326-5300.

Classification of Pesticides

The Ontario Pesticides Advisory Committee (OPAC) is responsible for reviewing and recommending to the Ministry of the Environment, the placement of pesticide products into one of six schedules used to control sale and use. Once approved by the Ministry of the Environment, classified products are posted on the OPAC website: www.opac.gov.on.ca. For more information call OPAC at 416-314-9230.

Certification and Licensing Growers and their Assistants

For information about certification for growers and training for assistants check the Ontario Pesticide Education Program website: www.ridgetownc.uoguelph.ca/opep or call 1-800-652-8573.

Commercial Applicators and their Assistants

For more information about exterminator certification and licensing and technician training check the Ontario Pesticide Training & Certification website at www.ridgetownc.uoguelph.ca/optc or call 1-888-620-9999.

Cette publication est aussi disponible en français.

1. PRINCIPLES OF INTEGRATED WEED MANAGEMENT

Integrated Weed Management (IWM) uses all available weed control strategies in the best possible way to manage weed populations. Such strategies include cultural, mechanical and chemical methods of weed control. All of these practices are components of an IWM system and none of these control measures on their own can be expected to provide acceptable levels of weed control. Therefore, instead of relying on only one particular method of weed control, an IWM system uses a combination of methods to control weeds. By following the principles of an IWM system we can reduce the use of herbicides and at the same time provide optimized economic returns to the grower.

Non-Chemical Weed Control

Non-chemical weed control can have many different approaches and success can only be achieved when several approaches are integrated into the weed management program.

- Identify and know your weed species
 - annual, biennial, perennial
- Have a planned approach (flexible strategy)
- Check fields regularly to adjust strategy
- Tillage practices – No-till, conservation tillage, moldboard?
- Secondary tillage frequency, timing
- Stale seed bed
- Crop rotation – crop competition
- Crop and variety selection
- Time of planting
- Row spacing, crop population
- Use clean crop seed
- Cleaning equipment between fields (cultivators, combines)

- Prevent seed production from weed escapes
- Fencerows and boundary areas
- Avoid excess nutrients
- Composted manure
- Cover crops – keep the soil covered, crop competition
- Healthy, biologically active soils
- Weed seed predation
- Mulch – plastic or crop residues
- Harrow – after planting, pre-emergence of crop
- Rotary hoe – after planting, pre-emergence of crop
- Harrow – after crop emergence
- Rotary hoe – after crop emergence
- Row-cultivation
- Thermal – flaming or steam/hot water
- Hoeing/pulling/walking the field
- Mowing

Field Scouting

Field scouting is a key component of an IWM system. It involves the systematic collection of weed and crop data from the field (weed distribution, growth stage, population, crop stage, etc.). The information is used, in the short term, to make immediate weed management decisions to reduce or avoid economic crop loss. In the long term, field scouting is important in evaluating the success or failure of weed management programs and for making sound decisions in the future.

Crop Rotation

Crop rotation involves alternating different crops in a systematic sequence on the same land. It is an important strategy for developing a sound long-term weed control program. Weeds tend to thrive with crops of similar growth requirements as their own and cultural

practices designed to contribute to the crop may also benefit the growth and development of weeds. Monoculture, that is growing the same crop in the same field year after year, results in a build-up of weed species that are adapted to the growing conditions of the crop. When diverse crops are used in a rotation, weed germination and growth cycles are disrupted by variations in cultural practices associated with each crop (tillage, planting dates, crop competition, etc.).

Cover Crops

The inclusion of cover crops such as rye, red clover, buckwheat and oilseed radish or overwintering crops like winter wheat or forages in the cropping system can suppress weed growth. Fast growing crops or crops exhibiting allelopathic properties can also suppress weeds. Highly competitive crops may be grown as short duration “smother” crops within the rotation. Additionally, cover crop residues on the soil surface will suppress weeds by shading and cooling the soil. Suppressing weeds in crop and after crop will reduce the numbers of viable weed seeds in the soil. When choosing a cover crop, consideration should always be given to how the cover crop and its management will affect the succeeding crop.

Intercropping

Intercropping involves growing a smother crop between rows of the main crop. Intercrops are able to suppress weeds. However, the use of intercropping as a strategy for weed control should be approached carefully. The intercrops can greatly reduce the yields of the main crop if competition for water or nutrients occurs.

Nitrogen Fertility

Nitrogen fertilizer can affect the competition between crops and weeds and in the subsequent crops. For example, nitrate is known to promote seed germination and seed production in some weed species. Nitrogen fertilization may result in increased weed growth instead of increased crop yield. Selective placement of nitrogen in a band can favour the crop over the weed. Use of legume residues as opposed to chemical nitrogen fertilizer to supplement nitrogen needs of the crop can enhance weed suppression. Legume residues release nitrogen slowly with less stimulation of unwanted weed growth.

Planting Patterns

Crop population, spatial arrangement and the choice of cultivar (variety) can affect weed growth. For example, studies have shown that narrow row widths and a higher seeding density will reduce the biomass of later-emerging weeds by reducing the amount of light available for weeds located below the crop canopy. Similarly, fast growing cultivars can have a competitive edge over the weeds.

Tillage System

Tillage systems alter the soil seedbank dynamics and depth of burial of weed seeds. Studies have found that almost 75% of the weed seedbank was concentrated in the upper 5 cm of soil in no-till fields. In the moldboard plow system however, the seedbank is more uniformly distributed over depth. Other conservation tillage systems are intermediate to these two systems.

Weed seedling emergence is often more uniform from shallowly buried weed seeds and may result in better weed control. Weed seeds closer to the soil surface are more likely to be eaten or damaged by insects, animals, other predators and disease causing organisms.

Preemergent or “Blind” Harrowing

Blind harrowing consists of waiting until after the crop has been planted, the seed is sprouted and the shoot is not yet emerged. At this crucial time, the field is harrowed to kill the small weed seedlings that have already sprouted. The crop will emerge shortly afterwards, having gained a head start on the next flush of weeds. When properly carried out, this method can be most effective in controlling annual weeds in large seeded crops. In cereals, this blind harrowing will often provide adequate control of annual broadleaf weeds. In row crops, it can be used to keep weeds down until the crop plants are large enough to withstand other mechanical control methods. Any type of light harrow can be used. Blind harrowing must not be done on crops previously underseeded with grass or legume seeds.

Weeder Harrow

A weeder harrow has spring tines that are gentle enough not to harm the cultivated crop, while uprooting or covering the smaller annual weeds. Therefore, the relative size of the cultivated plants and the weeds is important. Weeder harrowing will be most successful when used before the crop emerges and can also be used post emergent in many crops. Some crop population loss will result. Speed and pressure settings are important to minimize plant loss. They can be used most effectively on field vegetables, corn, soybeans and cereals.

Rotary Hoe

The rotary hoe has “fingers” that lift and mix the soil, uprooting small weeds. It is important to work at 10–20 km/hr for satisfactory results. Best results are obtained during late morning or afternoon hours when the hot sun can dry out the uprooted weeds. Also, crop plants tend to be more pliable at this time and injury is reduced. Rotary hoes tend to cause less crop damage than harrows. They are also effective in breaking up a soil crust and mixing surface-applied herbicides into

the soil, which will improve the weed control. On light soils or under loose soil conditions, care must be taken to keep the rotary hoe working at a shallow depth.

Inter-Row Cultivation

Shallow inter-row cultivation or scuffling of row crops uproots small weeds and cuts off larger weeds. Various types of equipment can be used but, when shovels are used, allow for up to 50% overlap for thorough weed control. Shields should be used to protect small crops.

Row cultivation can be used profitably when applying herbicides. The herbicide may be more effective and the amount of herbicide used can be reduced, particularly with band applications. To provide adequate weed control in long-season crops, such as corn, scuffling will probably have to be done more than once. The first cultivation is the most crucial since weeds that escape this pass can grow to maturity. Here again the relative size of the crop to the weeds is important and a factor in achieving 100% success. Use blind harrowing, weeder harrows and/or rotary hoes first to complement the inter-row cultivation to achieve success in non-chemical (organic) weed management.

Mowing

Mowing or cutting weeds may control weeds in orchards, roadsides, lawns, etc. Harvesting hay or cereal crops also helps to control weeds. Mowing cereal stubble in August can reduce weed growth and weed seed production, especially if the cereal had been underseeded to another crop such as red clover to compete with the new weed growth. The best time to mow perennial weeds is usually at the bud stage when root reserves are low and before seed set. Note that if a herbicide application is planned for later in the season, adequate time should be left for weed regrowth after mowing.

For more information, see individual crop sections.

CRITICAL PERIOD OF WEED CONTROL

The critical period of weed control is an important concept in IWM systems. This period has been defined as an interval in the life cycle of the crop when it must be kept weed-free to prevent yield loss.

This concept helps in determining the most effective time for non-residual postemergent herbicide applications, and reduces the practice of season-long residual herbicides, and unnecessary late applications of herbicides. The critical periods are defined relative to a crop growth stage to account for soil, weather and seasonal variations. The critical period is based on a yield loss of less than 5% due to weed interference. In other words, the crop has to be weed-free during these stages to prevent a yield loss of more than 5%.

If weeds have been controlled throughout the critical period, the weeds that emerge later will not affect yield and can be controlled prior to harvest with a harvest aid to burn down the weeds and desiccate the crop.

TABLE A. Critical Periods for Weed Control in Field Crops

Crop	Critical Period for Weed Control
Corn	3rd to 8th leaf
Soybeans	1st to 3rd trifoliate
White Beans	2nd trifoliate to 1st flower

The critical period can vary depending on weather and growing conditions. Some research with corn and soybeans has indicated that the critical period may vary

with soil type and tillage system and where the end of the critical period may be extended slightly later on clay soils or when using no-till tillage systems.

Corn – The critical period extends from 3–8-leaf stage (4–10-leaf tip showing in the whorl, or V2–V6). Excellent weed control must be maintained throughout this critical period. Corn kept weed-free for approximately 34 days after planting (DAP) or until 6–8-leaf stage (8–10-leaf tips) had a yield loss of 0–5% under conditions of heavy weed pressure.

Soybeans – The critical period extends from the 1st to the 3rd trifoliate stage of soybean growth (V2–V3). Soybeans kept weed-free for approximately 15 days after crop emergence had a yield loss of 0–5%.

White beans – The critical period extends from the 2nd trifoliate to the 1st flower (V3–R1) stage of white-bean (approximately 45 days after planting).

Horticultural crops are very sensitive to weed competition, and need to be kept weed free from planting, emergence or budbreak, until the end of their critical weed-free period. This differs slightly from the critical period for weed control, but is useful for crops where soil applied preemergent herbicides or cultivation are the main option for controlling weeds. If the crop is kept weed free for the critical weed-free period, generally no yield reduction should result. Again, weeds emerging after the critical weed-free period will not affect yield, but control efforts after this time may make harvest more efficient, or reduce weed problems in subsequent years in perennial crops.

TABLE B. Critical Weed-free Period for Horticultural Crops

Crop	Critical Weed-free Period
Apples, new plantings	During May and June
Apples, bearing	Budbreak until 30 days after bloom
Beets	First 2–4 weeks after emergence
Cabbage, early	First 3 weeks after planting
Carrots	First 3–6 weeks after emergence
Cucumbers, pickling	First 4 weeks after seeding
Lettuce	First 3 weeks after planting
Onions	First the whole season
Potatoes	First 4 weeks after planting
Squash	Early plantings compete better
Strawberries, new	During May and June
Tomatoes, fresh	First 36 days after transplanting
Tomatoes, seeded	First 9 weeks after seedling

TABLE C. Percent yield loss in corn due to known populations of annual grass and broadleaf weeds that have emerged with the crop and been left uncontrolled*.

Economic Thresholds

Weed economic thresholds help in determining if weed density and interference is sufficient to justify control measures, i.e., if the yield loss avoided is greater than the cost of weed control. The time at which weeds emerge relative to the crop is a major determinant of yield loss. Early weeds that emerge at the same time as the crop cause more yield loss than weeds emerging after the crop is established. For example, economic threshold

studies conducted with redroot pigweed, ragweed and barnyardgrass have found that the time of weed emergence in relation to the crop stage is more important than weed density when evaluating weed control options. Crop yield loss depends on the relative time of weed seedling emergence. Tables C and D estimate the amount of yield loss associated with certain weeds emerging in corn and soybeans.

Critical periods and economic thresholds however do not apply in the same way to weeds, such as black nightshade, which may reduce the quality of the crop. In such cases the economic threshold may be zero.

MANAGING WEEDS RESISTANT TO HERBICIDES

Resistance of weeds to herbicides is not a unique phenomenon. In fact, resistance to antibiotics, insecticides and fungicides is a world-wide problem that is not confined to any single pathogenic pest category.

In Ontario resistance has been reported to Groups 2, 4, 5, 7, 9 and 22 as listed in Table E. In western Canada and the United States resistance has developed to Groups 1, 2, 3, 4, 5, 8 and 9 (refer to Table 4-5, page 64).

NOTE 1: For control of a particular triazine-resistant species, select an effective non-triazine (non-Group 5) herbicide, or select a tank mix or premix with an effective non-triazine (non-Group 5) herbicide component (see Table 4-5, page 64).

NOTE 2: Group 2 ALS resistant weeds. Biotypes of pigweed have been found that are resistant to one or more of the Group 2 herbicides. Resistant strains are difficult to distinguish from susceptible types. For control of a resistant species select an effective non-Group 2 herbicide, or select a tank mix or premix with an effective non-Group 2 herbicide component (see Table 4-5, page 64).

Delaying Herbicide Resistance

Herbicide resistance results from a change in a weed population over time after repeated application of the same group of herbicides. The result is reduced weed control in the field. Resistance to different types of herbicides develops at different rates among weed species and populations. To prevent or slow the development of resistant weeds on your farm, take the following common-sense approaches.

1. Identify and Monitor:

Resistant weeds do not look different. Therefore, they are hard to identify. Furthermore, weed "escapes" are common after herbicide application.

Resistance does not usually become obvious until 10%–30% of the population become resistant. Survey your fields regularly and apply the methods of diagnosing herbicide-resistant weeds to catch problems as they arise.

2. Prevent the Spread of Weeds:

When entering or leaving a field, clean all implements. Do not allow resistant weeds to go to seed.

3. Use Alternatives to Chemical Weed Control:

Combine mechanical weed control, such as rotary hoeing or cultivation, with chemical weed control where possible.

4. Rotate Crops and Herbicides:

Rotate herbicide usage so that the same herbicide group is not used year after year. One of the easiest ways to rotate to a new herbicide group is to rotate to a new crop. Then use a herbicide from an alternative group. Refer to Table 4-5, page 64, for help selecting herbicides from different groups. This preplanning will prevent the same herbicide group from being used too often. When it is practical, use tank or formulated mixtures where both active ingredients within the tank act to kill the same weed in a completely different way.

5. Keep Records:

Keep accurate records of crop rotations and herbicide use in all your fields. It will be easier to plan long-term weed management strategies if you have good records.

6. Communication:

Stay in touch with farmer organizations, extension specialists, agribusiness, friends and neighbours about resistance problems they are encountering. Let your government or industry representative know about any cases of resistance so they can take the appropriate action to prevent spread of the weeds.

Diagnosing Herbicide-Resistant Weeds

Before assuming that any weeds surviving a herbicide application are resistant, rule out other factors that might have affected herbicide performance. Those factors are misapplication, unfavourable weather conditions, improper timing of herbicide application, and weed flushes after application of a non-residual herbicide. If resistance appears to be likely, check for the following:

1. Are other weeds listed on the product label controlled satisfactorily? Usually, only one weed species will show herbicide resistance in any given field situation. Therefore, if several normally susceptible weed species are present, reconsider factors other than herbicide resistance.
2. Did the same herbicide or herbicides from the same group (see Table 4-5, page 64) with the same site of action fail in the same area of the field in the previous year?
3. Do your records show extensive use of the same herbicide or herbicides from the same group year after year?

If one or more of these three situations apply, it is possible that the weeds are resistant to the herbicide. If resistance is suspected, control the weeds with a labeled herbicide from another group or use appropriate non-chemical weed-control methods to prevent the weeds from going to seed. Next, contact your weed specialist, herbicide supplier and the appropriate chemical company to develop a comprehensive weed-control program to manage the problem.

For more information on herbicide resistance see:

- OMAFRA Factsheet 01-023, *Herbicide Resistant Weeds*
- International Survey of Herbicide Resistant Weeds at: <http://weeds science.com/>
- Herbicide Resistant Weeds in Ontario at: www.plant.uoguelph.ca/resistant-weeds/

TABLE E. Herbicide Resistant Weed Populations Confirmed in Ontario (as of Dec. 2007)

Herbicide Group*	Weed Species	Location(s)
2	pigweed – redroot & green	Bruce, Elgin, Essex, Hamilton-Wentworth, Huron, Kent, Lambton, Middlesex, Oxford, Perth, Stormont, Dundas and Glengary (SDG), Wellington
2	common lamb's-quarters	Elgin, Kent, Middlesex, Simcoe
2	green foxtail	Huron, Lambton, Perth, Wellington, Victoria
2	giant foxtail	Lambton
2	common cocklebur	Lambton
2	eastern black nightshade	Bruce, Elgin, Huron, Middlesex
2	common ragweed	Elgin, Essex, Haldimand/Norfolk, Huron, Kent, Lambton, Middlesex, Oxford, Perth
2	waterhemp	Bruce, Lambton, Essex
4	wild carrot	Halton, Wellington
5	common lamb's-quarters	Numerous counties throughout Ontario
5	redroot pigweed	Waterloo
5	common ragweed	Brant, Essex, Haldimand/Norfolk, Hamilton-Wentworth, Lambton, Lennox & Addington, Niagara, Wellington
5	barnyard grass	Waterloo
5	yellow foxtail	York
5	old witch grass	Grenville, Grey, Haldimand/Norfolk, Prescott, Wellington
5	late flowering goosefoot	Brant
5	wild mustard	Glengarry
5	common groundsel	York
5	common waterhemp	Essex, Lambton
6	redroot pigweed	Essex, Kent
6	smooth pigweed	Essex
7	green pigweed	Middlesex
7	redroot pigweed	Simcoe
22	Canada fleabane	Essex
22	field peppergrass	Essex

*The above weed populations have been found to be resistant to some or all of the herbicides in the indicated herbicide group. Refer to Table 4-5, page 64 for a list of herbicides associated with each herbicide group.

Testing for Herbicide-Resistant Weeds

The University of Guelph "Weeds Lab" can test for resistance of suspected weed species. For more information call 1-877-424-1300.

USE OF CHEMICALS TO CONTROL WEEDS

Chemicals may be used to control weeds either selectively in crops or non-selectively for the control of perennial weeds or on land not in crops, such as roadsides, fencerows and areas difficult to cultivate. The treatments listed in this publication are based on extensive field and observation on farms. Herbicides should not be used in cold frames or greenhouses unless specifically recommended.

Time of Herbicide Treatment in Crop Areas

The susceptibility of both crops and weeds to herbicides is related to the time of application. Therefore, it is important to use the chemical at a time when the crop is at its maximum resistance and the weeds are at their maximum susceptibility. This time will vary depending on the crop involved and the herbicide used. Terms describing the times at which herbicides may be applied, unless specified differently, refer to the stage of development of the crop plants.

Preplanting Treatments

Preplanting (PP) treatments are applied before the crop area is sown or planted. Some herbicides used in this way act on germinating seedlings, others may also kill weed seeds. When used preplanting, some herbicides must be thoroughly incorporated (PPI) with the soil soon after application. Directions for incorporation are given throughout the publication where these herbicides are recommended.

Preemergence Treatments

Chemicals used in preemergence (PRE) treatments are applied after seeding but before the specified weed or crop emerges. The chemicals may control weeds by (1) killing weed seedlings and/or (2) establishing a toxic layer of chemical on or near the soil surface in which germinating seeds and young seedlings cannot survive.

For successful preemergence treatments the crops must either be tolerant of the chemical at the seedling state or the toxicity must have disappeared before the crop emerges.

A smooth, well-prepared seedbed that is free of clods is necessary for best results. The surface soil should also be moist and the temperature favourable for the rapid germination of weed seed.

Postemergence Treatments

Postemergence (POST) treatments are applied after the crop and weeds have emerged. A selective chemical is used and the weeds are killed with little damage to the desirable plants. The types of weeds that may be controlled depend on (1) the susceptibility of the weed, and (2) the tolerance of the crop to the chemical. Treatment at the correct stage of crop development is important. Since most weeds are more susceptible to chemicals when young, early treatments will require less herbicide and will result in less damage to crops from weed competition and from spray equipment.

Sometimes a herbicide may be applied postemergence to the crop but preemergence to the weeds. For example, a crop may be cultivated, then a herbicide applied to the weed-free soil to control germinating weeds.

Chemical Weed Control in Non-Crop Areas

Treatment with "Soil Sterilants"

Perennial weeds may be killed and the growth of annual weeds prevented by the use of soil-active chemicals,

which are toxic to most plants. These "soil sterilants" may be applied at any time. Best results are obtained if application is followed by a period of rainfall.

Treatment with Translocated Chemicals

In eliminating perennial weeds, heavier dosages of 2,4-D and of other translocated chemicals must be applied than would normally be used in crop land. Mixtures of 2,4-D with other chemicals may be used to keep areas free of vegetation.

Treatment with Contact Chemicals

These chemicals are not selective but kill all foliage they contact. While this will kill annual weeds, regrowth usually develops from the roots or crowns of perennial plants.

Conservation Tillage

All herbicides recommended for use in specific crops in the conventional tillage sections of this publication can be used in conservation tillage systems provided that they are used according to the labeled uses and the labeled rates.

Minimum Tillage involves very little use of tillage equipment for seedbed preparation. The soil, however, is tilled prior to seeding, resulting in somewhat rough planting conditions by conventional standards. There is very little living vegetation and a crop residue cover of more than 20% after seeding. Weed control in this cropping system is similar to weed control in conventional tillage. Preplant incorporated herbicide treatments may not be practical if crop residues are heavy. Good uniform soil mixing is required to produce satisfactory results with incorporated herbicides. If this condition cannot be achieved without extra tillage, then the preferred method would be to use preemergent or postemergent herbicides. Use inter-row cultivation with herbicides. Burndown treatments are not normally required.

Ridge Tillage involves seeding the crop directly into the ridge formed by aggressive cultivation the previous year. The ridge planter skims off 2–5 cm of soil, crop residue, weeds and weed seeds from the top of the ridge and deposits these in the hollows between the rows. Preplant incorporated treatments are impractical with this system. This system is well suited to broadcast and/or banded applications of preemergent or postemergent herbicides. Excellent results have been obtained by band-applying preemergent herbicides at planting time to fresh, moist soil directly behind the seeding unit on the planter. Also, timely cultivation between crop rows while, at the same time, spraying the crop row with postemergent herbicides can provide excellent weed control. The ridging procedure that follows provides additional mechanical weed control. Proper adjustment of the ridge planter and early cultivation after seeding may eliminate the need for a burndown treatment. (A burndown treatment may be required prior to crop emergence if cultivation is delayed after seeding).

Strip Tillage suggests that only narrow bands of soil in the seeding area are tilled by either power-driven rototillers or fluted coulters. The area between rows is left untilled and the crop residue is undisturbed. Success with preplant incorporated treatments depends on the amount and type of residue, the nature of the specific herbicide and the tilling device used. Row middles are not usually cultivated but could be if appropriate equipment is available for inter-row cultivation. Usually, broadcast application of preemergent or postemergent herbicides is used. Band applications could be used if inter-row cultivation is an integral part of the production system. If vegetation is present at seeding time, a burndown treatment is necessary.

No-Till cropping systems are the most demanding with regards to weed control. The crop is seeded directly into untilled soil with no follow-up cultivation. Weed control depends entirely on herbicides. Burndown treatments are almost always required. Preemergent and postemergent herbicides are used to control weeds throughout the entire growing season. Crop residues

may intercept a portion of preemergent herbicide. If rainfall is sufficient to wash the herbicide from the crop residue into the soil, weed control results will be satisfactory. However, if dry conditions follow application, results could be very disappointing. Postemergent foliar-applied herbicides are more appropriate under dry conditions.

Weed Population Shifts

Weed population shifts is a term that refers to the changes in the kinds of troublesome weeds that occur with a change in tillage systems. When tillage is reduced the environment of weed seeds and underground parts of perennial weeds is altered. These environmental alterations affect weed species differently. Deep burial of weed seeds under conventional tillage systems enforces seed dormancy and increases the life of seeds, perpetuating weed problems. Reducing tillage keeps more weed seeds at the soil surface where they are subject to the ravages of nature. Greater percentages of seed at the soil surface are destroyed before they germinate (by winterkill, birds, insects or rodents). Most seeds that do survive germinate sooner and, if they are controlled, they do not return seeds to the soil. If good weed control is obtained in the early years of reduced tillage, eventually the weed seeds in the soil become fewer, reducing the potential of serious weed problems that originate from seed. Pressure from annual weeds tends to decline after a few years in reduced tillage. On the other hand, reduced tillage favours weeds that reproduce from underground roots and stems; these underground parts are not mechanically injured or destroyed in reduced tillage systems. Perennial and biennial weeds tend to be more troublesome in ridge-till, strip-till and no-till fields. In reduced-tillage fields, these weeds emerge earlier and do not spread as much as they do in conventionally tilled fields. This allows more appropriate timing for spray application and more spot treatments. The most effective herbicides are foliar-applied systemic types

that translocate well to underground plant parts before the above-ground parts are killed. When non-selective herbicides are used, perennial and biennial weeds must be treated between crops or the crop must be sacrificed in treated areas.

Burndown treatments are meant to kill existing vegetation before crops emerge. Burndown treatments may be required in minimum tillage, especially when cover crops are used; in ridge-till when seeding is delayed and/or when winter annual, biennial or perennial weeds are present; and almost always in no-till and strip-till fields. Vegetation can be killed by:

- contact herbicides like paraquat
- translocated systemic herbicides like glyphosate, dicamba or 2,4-D
- residual herbicides that have postemergence foliar activity such as atrazine, linuron or metribuzin plus surfactants or oils and
- a contact or systemic herbicide tank mixed with a residual herbicide such as paraquat + atrazine or glyphosate + dicamba.

All of these treatments are most effective on young, actively growing plants. Coverage is extremely important with contact treatments. Burndown treatments do not necessarily provide residual weed control.

When dense, vigorous growing vegetation is present just before or at planting time, large amounts of soil moisture are removed by that vegetation. This can be an advantage during springs when there is an overabundance of soil moisture, but is a definite disadvantage during springs when dry conditions prevail. Because of this situation, consideration should be given to early application of burndown herbicides, perhaps even the previous fall when perennial cover crops or sod fields are involved. Under dry conditions, a rapid-

acting burndown would be preferred over a slower-acting treatment.

For more specific information see also the individual crop sections such as Corn (Field and Sweet) and Soybeans.

Applying Herbicides

An exterminator's license may be required by a person applying herbicides on property other than their own domestic property. An operator's license is required by a person operating an extermination business. For further information, contact any Ministry of the Environment Regional Office or the Ministry of the Environment Pesticides Section, 135 St. Clair Avenue West, Toronto, ON M4V 1P5.

Successful chemical weed control requires the application of the correct quantity of herbicide uniformly over the area. With selective weed control in field crops, this application becomes a precision operation.

The chemical is applied as an emulsion, solution or suspension. The volume of the mixture used per hectare depends on the herbicide and the crop being treated. Generally, low volumes (50–200 L/ha) are used when 2,4-D chemicals are sprayed on emerged weeds, and higher volumes (150–300 L/ha) when preemergence herbicides are applied.

Small areas may be treated with a garden sprayer, or even with a watering can, if care is taken to wet all foliage.

Power equipment is necessary for larger areas. Equipment used for applying 2,4-D-like chemicals should not be used later for applying other solutions to 2,4-D susceptible crops or garden plants.

2. APPLICATION TECHNOLOGY

INTRODUCTION

Herbicide application should be a precision operation. Recent advances in equipment and control systems can make the job relatively simple and precise.

Pesticides applied incorrectly may result in wasted pesticide, poor or no control, damage to crops (possibly the neighbour's) or environmental contamination. Every effort must be made to apply chemicals properly to help eliminate these undesirable effects.

Developments in New Equipment

In building sprayers that accurately apply herbicides, equipment manufacturers work closely with the crop-protection industry. New concepts, such as closed-injection systems with herbicide concentrate carried separately from the water carrier, are now in use. Electronic rate controllers provide more accurate spray application by utilizing speed sensors, flow controllers and microprocessors to maintain the desired application rate. This technology has also included radar to accurately sense true ground speed of the sprayer. Rate controllers are common among the professional applicators.

The industry is currently working towards the closed-injection system. Work continues in the area of drift reduction using air assists and electrostatic methods.

Nozzle manufacturers have brought to the market air-induction nozzles that significantly reduce spray drift. These nozzles are made by a number of companies and are available in a range of sizes. Operating these nozzles

within their working pressure range is crucial to ensure designed spray angle development and proper air induction into the nozzle. Before buying a certain brand of air induction spray tips, make sure your sprayer pump can produce sufficient pressure to operate these tips under all conditions. Check with the nozzle manufacturers for operating pressures required.

Sprayers for Home Use

A 9–14 L backpack, hand-held or compressed-air garden sprayer is satisfactory for use on lawns and around the home. A nozzle tip that produces a fairly coarse spray will help reduce spray drift. Care should be taken to keep the pressure relatively low; high pressures produce more fine spray droplets, which can drift in light winds to susceptible plants. The sprayer should be reserved for use only with herbicides and should not be used to apply insecticides or fungicides.

Field Sprayers

The most common sprayer used in herbicide application is the boom-type sprayer. This sprayer applies a uniform amount of spray solution across the width of the boom.

The main requirements for field spraying are:

- a uniform pressure across the whole boom
- all nozzles have the same output and a good spray pattern
- a uniform forward speed in actual field conditions
- a stable boom height to ensure proper overlap of the nozzle-tip patterns

Most commercially built sprayers can be adapted and used safely to apply liquid fertilizers. Extra agitation may be required. Ensure that the sprayer components being used are compatible with the fertilizer formulation and follow the manufacturer's recommendations.

Air-Blast or Mist Sprayers

These machines should never be used to apply herbicides, especially hormone-type herbicides such as 2,4-D. The danger of causing herbicidal damage at a great distance from the treated area is very great.

Wiper Applicators for Selective Weed Control

Wiper applicators (rope-wick, roller applicator or similar device) have been extensively used with glyphosate (ROUNDUP). Check product labels for use of this application technique with other herbicides. Product labels list the crops for which this technique is registered. The main criteria for using wiper applicators are:

- contact enough of the target plant to get herbicidal effectiveness
- keep the wick application above the crop to avoid crop injury

Travel speeds should be 4–10 km/hr for wick application. Two passes in opposite directions may be beneficial, especially in heavy weed infestations and where higher vehicle speed is contemplated. Care must be taken not to contact sucker growth in orchards, vineyards and shelterbelts. This may result in crop injury. **Follow manufacturer's directions.**

FIGURE 2-1. CONVENTIONAL VS. AIR INDUCTION NOZZLES

**Air Borne Spray Drift Potential Expressed as
a Percentage of the Drift from an Extended Range Flat Fan Nozzle**

CARE AND USE OF EQUIPMENT

Spraying Speeds

Because most agricultural and roadside herbicide must be uniformly applied, the forward speed of a sprayer must be constant whenever the nozzles are delivering liquid. If the driving wheels of a tractor slip on the soil surface, the tractor's speedometer does not indicate a change in forward speed. To be certain that the forward speed is constant in spite of wheel slippage on hills, use an independent speedometer powered by a non-driven wheel. Spray monitors and other electronic rate controllers also may be installed. Only rate controllers will automatically adjust for variation in tractor speed to maintain a constant rate of application.

Water

Use only clean water that contains no debris, sand or mud. On your farm water supply, use a frost-free water hydrant located outside the building. An anti-backflow or anti-siphon valve should always be installed on any hydrant or water supply. Never allow the intake screen to rest on the bottom of a farm pond while filling a sprayer. The intake line near the screen must, by law, be equipped with a check valve or anti-backflow device to prevent contamination of the pond or stream when the pump is shut off. The use of a tank-refilling nozzle, volume-booster nozzle or injection pump to aid in refilling the sprayer tank from farm ponds or streams must be avoided. These tank-refilling aids may cause pond or stream contamination.

Agitation

When chemical formulations in solution are used (2,4-D and water) at least 2–14 L/min should be returned to the tank for agitation within the tank. Higher rates will apply with wettable powders. To be effective, the agitation line from the pump should pass through a control valve and deliver the liquid to the bottom (not the top) of the tank. Agitation nozzles or a sparge tube should always be used to ensure sufficient liquid circulation in the tank.

When wettable powders (atrazine, etc.) are used, the return to the tank should be 14–27 L/min for each 450 L of tank capacity, depending on the concentration of the wettable powder and the size of the tank. A dedicated line from the pressure side of the pump (not the pressure regulator) to the tank must be used to carry the liquid necessary for hydraulic agitation in the tank. Always use a venturi jet or sparge tube. This flow can be reduced if the sprayer has a mechanical agitator. Sparge tube agitation requires more water than venturi to give the same agitation.

Avoid excessive agitation of the mixture, as it may turn into an invert emulsion, a grease-like mass that will settle to the bottom of the tank and cannot be pumped. Excessive agitation may also cause foaming resulting in pumping problems. To prevent a build-up of oil in the sprayer, the tank should be emptied completely before refilling. After any break in the spraying operation, agitate thoroughly before proceeding. Clean the tank and sprayer immediately after use with a detergent or solvent and flush with clean water.

Pumps

The pump is the most important part of the sprayer. The pump should have adequate capacity to maintain the desired pressure, volume and agitation. Piston, diaphragm and centrifugal pumps are the best for pumping wettable powder suspensions. For liquid herbicide applications, roller pumps may be used in addition to the above types. When used for wettable powders or flowable formulations, choose a pump with an

abrasion-resistant housing. Carefully follow the manufacturer's care and storage instructions for the best pump performance.

CAUTION: Running a spray pump without water may cause damage or premature wear.

Nozzle Tips

Numerous companies make spray nozzles. These may be similar in design but may have slightly different set-up requirements to get uniform spray coverage. Always follow manufacturers' recommendations for nozzle spacing / nozzle-to-target distances. These distances may vary according to the spray angle of the nozzle. Proper geometry is essential to ensure adequate overlap of adjacent nozzle spray plumes.

Care should be taken to maintain a stable boom height to assure uniform overlap of the nozzle spray patterns.

The success of the spray application is dependent in part on the condition of the nozzle tips and uniformity of application across the whole spray boom. The spray pattern of all nozzles should be examined prior to their use. In addition, each and every nozzle should be checked when calibration of the sprayer is done.

Materials used for nozzle tips range from brass, stainless steel, hardened stainless steel, as well as plastics/polymers and ceramics. All product formulations and carriers cause wear of the nozzle orifice, wettable powders more than others do.

Sprayers should be calibrated routinely. (See note on calibration below).

Nozzle tips should be replaced when they deliver 10% more than manufacturer's rated output specifications. Worn nozzle tips may provide uneven distribution of spray solution and cause changes in the spray pattern. This may result in uneven delivery and produce streaks

across the field. Flat fan nozzle tips are widely used on boom sprayers to apply herbicides. Spraying operating pressure should be within recommended limits outlined by the nozzle manufacturer. Nozzles with a 110 degree spray angle have more overlap than 80 degree nozzles, resulting in a wider spray angle, which allows less chance of spray skips as the boom moves closer to the ground. Always follow manufacturer's recommendations for spacing and minimum nozzle to target distance and spray operating pressures.

Flat fan nozzle tips that will operate at reduced pressure, approximately 140 kPa, are available. These nozzle tips can further reduce the potential of drift.

Air induction or venturi nozzles are now available from at least ten different companies. These nozzles were specifically designed to reduce the amount of fine droplets produced in the smaller nozzle sizes. The nozzle manufacturers offer air induction or venturi nozzles in a wide range of sizes.

These nozzles draw air into the nozzle as the spray liquid passes through the nozzle. The end result is the production of a coarse spray with very few fine spray droplets that are drift prone. These coarse droplets contain air bubbles that cause the droplets to rupture upon impact with plant surfaces.

Air induction nozzles are made in two pressure ranges, low pressure and high pressure. If your sprayer cannot exceed 345 kPa, you should only consider a low-pressure design. All venturi nozzles should be operated in the middle of their working range. For the low pressure designs this is approximately 275 kPa and in the high-pressure designs, about 550 kPa. All venturi nozzle designs are extremely sensitive to low working pressure. The spray patterns will collapse to less than their designed spray angle if the nozzle pressure is too low. This will result in a distorted spray pattern. In addition, the induction of air into the spray liquid will not occur if the pressure goes below a certain point.

Many producers have quickly adopted this new nozzle technology. The significant reduction in spray drift, compared to conventional flat fan nozzles, is a welcome feature. Some producers are using these nozzles for all their herbicide spraying. Some product performance problems have occurred when air induction or venturi nozzles have been used. One or more of the following factors may contribute to this. Poor timing of spray, reduced water volumes, spray pressures that are too low and difficult-to-wet weeds may all contribute to poor control.

Special even-spray nozzle tips are available for band spraying applications of herbicides. These even flat fan nozzles deliver a uniform amount of spray over their sprayed area. A variety of sizes, spray angles and nozzle materials are available. The nozzle-to-target height, and spray angle of the nozzle tips as well as its orientation to the direction of travel, determines the width of the sprayed band. Carefully follow manufacturer's literature and directions.

Flooding nozzle tips are used at low pressures and, because of their wide spray angle, can be used closer to the ground surface, thus reducing the drift hazard. New flooding nozzle tip designs have improved the spray distribution patterns to the point that it is as good as with the flat fan tips. Flooding nozzle tips are available in brass, plastic/polymers and stainless steel. Half as many of these nozzle tips are required to cover the same width as would be required with flat fan nozzle tips. Sprayers equipped with a broadcast type of nozzle cover a wide swath. They are especially convenient for farm lane and fence row spraying where a uniform spray pattern is not essential. The spray pattern is affected by wind and severe drifting may occur with even a light breeze. Never use a broadcast-type of nozzle to spray near a susceptible crop.

Full or hollow cone nozzle tips may be used for applying herbicides to the soil surface when the herbicide is incorporated or mixed into the soil with a disk harrow, cultivator or similar tillage implement.

NOTE: When using any nozzle for spraying wettable powders or micro-nutrients, it is essential to calibrate the sprayer frequently because, as a nozzle wears, the quantity of spray material delivered increases and distribution is uneven. Worn nozzles usually result in a very poor spray pattern.

Nozzle manufacturer's catalogues will list screens required for various nozzle types and sizes. Diaphragm check valve nozzle bodies will ensure dripless operation when the boom is turned off. To clean nozzle screens, remove them from the nozzle bodies and wash thoroughly with soap and water, using a nozzle tip bristle brush. Simply flushing water through the boom and nozzles will not remove pesticide residue that has built up on the outside of the nozzle screens.

Cleaning the Sprayer

Before cleaning the sprayer, dispose of surplus tank mix. As suggested in the Grower Pesticide Safety Course, one method of disposal is to dilute the remaining spray solution at least 10:1 with water. This diluted solution can be applied to the previously treated area as long as the maximum recommended product rate on the label, is not exceeded.

Clean out the sprayer immediately after finishing the day's work or when changing chemicals. At the end of each spray day, thoroughly flush out the boom with plenty of water to rinse lines, diaphragm check valves and nozzles. Delaying cleanout, even overnight, can allow the formation of hard-to-remove deposits. The sprayer tank is much more difficult to clean out, if it is allowed to dry. Residue build-up can also result from numerous applications of a herbicide over a period of days or weeks with no cleaning or rinsing in between. Don't forget to also clean out the measuring containers.

Steps:

1. Read the product label to determine the recommended cleaning procedure. Have ready all the materials required for the cleanup, including appropriate personal safety equipment.
2. Drain spray tank.
3. Fill tank with water and add detergent, ammonia or other tank cleaner product and allow to agitate for 10–20 minutes (clean the whole tank not just the bottom half). Flush boom and hoses with solution, allow to stand for several hours (or overnight if possible) and then flush boom and nozzles again and drain tank. When flushing the boom, open the boom ends to get particles out of the boom.
4. Inspect inside of tank for visual residues; rinse inside of tank if necessary. Repeat step 2.
5. Wash outside of sprayer with soap or mild detergent and water.
6. Remove nozzles, screens, and wash separately in a bucket containing cleaning solution. Don't forget to wash out your measuring container with the cleaning solution.
7. Remove all boom end plugs or caps. Product residues collected in the ends of the various boom pipe sections could cause crop injury. Thoroughly clean out the plugs or caps and pipe ends with cleaning solution. Carefully replace all the boom end plugs or caps.

Thoroughly rinse the tank, hoses, booms, nozzles and screens with clean water for a minimum of 10 minutes. Repeat immediately before your next use.

Use household detergent at rate of 250 mL/100 L or 1 kg/150 L of water. Use ammonia (3%) at 1 L/100 L of water. Use other cleaning agents according to label directions. Never mix ammonia with chlorine bleach

Chlorine gas is produced which may cause severe eye, nose, throat, or lung irritation.

NOTE: Contact the manufacturer of pesticides being used to determine the best methods and product(s) to clean residue from tanks and associated equipment. **Read the label**, since many products, e.g. ACCENT, BANVEL II, CONQUEST, PEAK, etc. provide tank-cleaning information on their label. Some products such as AGRAL 90, or ALL CLEAR, are recommended as tank cleaning agents.

Do not use equipment that has applied Group 4 (2,4-D, MCPA and related phenoxy herbicides) or many of the Group 2 herbicides should not be used to spray fungicides or other materials on susceptible crops and should not be parked or stored near greenhouses or other areas where susceptible crops are grown.

Clean the spray tank, booms and hoses first. Be sure to also clean the nozzles and tips, screens, filter, strainer and pump. These parts are often overlooked, and can trap residues. Because of today's highly active, low-use-rate herbicides, it is essential to clean out every trace of herbicide.

When surfactants or fertilizer solutions (e.g., AGRAL 90, 28%UAN) are used in a recommended mix with herbicides, there may be some inadvertent cleaning of previous residues from the tank/equipment that could affect the crop. Proper cleanout when changing products is essential to prevent crop injury.

The wash water contains herbicide. Never allow wash water to run into a well, lake, pond, river or other water source.

Do not leave puddles that may be accessible to children, pets, farm animals or wildlife.

SPRAYER CALIBRATION

Field Boom-Type Sprayer Calibration

(Determining application rates in L/ha.)

There are many ways of determining the number of litres of spray material that are being applied to 1 ha of land.

Instructions

1. Measure the time.

- Place 2 stakes 50 m apart in the field.
- Select the gear and throttle setting (rpm) at which you plan to spray. Half-fill the sprayer with water.
- Drive the distance between the stakes three times, timing each pass. Each time, make sure the tractor is at the desired speed as you pass the first stake. Keep driving at this speed until you pass the second stake.
- Note the average time of the 3 passes.

2. Measure the average nozzle output.

- Park the sprayer with the PTO engaged and the throttle adjusted to reach the PTO speed set in the test run.
- Adjust the pressure regulator to the desired working pressure with full flow to the boom.
- Collect the output from each nozzle for the average length of time needed to travel the 50 m in the test run.
- Enter the nozzle outputs into the equation below.

- If any nozzle is more than 5% above or below the average output, it should be cleaned or replaced.

3. Measure the nozzle spacing in metres.

4. Use the following formula to determine the sprayer output:

$$\text{Sprayer Output (Litres/hectare)} = \frac{\text{Average Nozzle Output (mL)}}{\text{Nozzle spacing (metres)}} \times 0.2$$

5. Calculate the actual area sprayed after each tank of spray solution is applied. Re-check the sprayer calibration after each tank of spray is applied by dividing the volume sprayed by the area sprayed. The nature of some products may slightly alter the calibration from that of clean water.

6. Growers who prefer to measure in litres/acre or gallons/acre can use the following conversion guide.

$$\begin{aligned}\text{Litres/hectare} \times 0.4 &= \text{L/acre} \\ \text{Litres/hectare} \times 0.09 &= \text{Imp. gal/acre} \\ \text{Litres/hectare} \times 0.11 &= \text{U.S. gal/acre}\end{aligned}$$

Sample Calculation

$$\begin{aligned}\text{Average time to travel 50 m (164 ft)} &= 24.5 \text{ sec} \\ \text{Average amount of liquid collected per nozzle for 24.5 sec} &= 525 \text{ mL} \\ \text{Nozzle spacing on the boom} &= 0.5 \text{ m } (\approx 20 \text{ in.}) \\ \text{Application rate} &= \frac{525 \text{ mL}}{0.5 \text{ m}} \times 0.2 = 210 \text{ L/ha}\end{aligned}$$

$$\begin{aligned}210 \text{ L/ha} \times 0.4 &= 84 \text{ L/acre} \\ 210 \text{ L/ha} \times 0.09 &= 18.9 \text{ Imp. gal/acre} \\ 210 \text{ L/ha} \times 0.11 &= 23 \text{ U.S. gal/acre}\end{aligned}$$

Band Spraying: If the sprayer has 10 nozzles and each nozzle covers a 36 cm (0.36 m) band, the total width of the spray patterns (swath width) is: 10 x 0.36 or 3.6 m.

Note 1: Sprayer-calibration bottles or kits are available from a number of suppliers. For further information contact your local office of the Ontario Ministry of Agriculture, Food and Rural Affairs or manufacturers of sprayers, sprayer parts or herbicides.

Note 2: For banded-spray applications, measure the width of the spray band (at the soil surface or surface of the crop canopy) and enter this value into the formula instead of the "nozzle spacing". Note that in band spraying the acreage sprayed is **not** the same as the crop acreage. (When broadcast spraying a row crop with 1 m rows, the whole field is treated. A band spray may only treat 30 cm over each row. Therefore, only 1/3 of the field is actually treated.) The herbicide rates referred to in most herbicide publications and labels refer to the actual area sprayed unless otherwise stated.

Hand-Held/Backpack Sprayer Calibration

Many people use small hand-held or backpack sprayers for treating problem areas or spraying areas that were missed. Calibration of these sprayers is as important as calibrating your field sprayer.

Method 1

- Measure an area that is 100 sq. m.
e.g., 10 m x 10 m, or 25 m x 4 m
- Fill the spray tank with water. Mark the level on a measuring stick. Pump to the pressure that will be used during the pesticide application.
- Spray the water over the 100 sq. m area. Walk at a steady pace, taking care to apply it as evenly as possible, just as you would when applying pesticide.
- Measure the amount of water needed to refill the spray tank to the mark on the measuring stick. This amount will be the sprayer output per 100 sq. m.

Method II

1. Set 2 stakes 50 m (164 ft) apart in the field.
2. Half-fill the sprayer with water.
3. Walk the 50 m three times at a steady pace. Calculate your average time to travel the 50 m.
4. Measure the width of the band sprayed by the nozzle (in metres) at your walking pace.
5. Pump the sprayer for the same amount of time as calculated in step #3, collecting the liquid from the nozzle in a measuring device.
6. Application rate (L/ha) =
$$\frac{\text{mL liquid per nozzle}}{\text{Band width (metres)}} \times 0.2$$

Method III

1. Partially fill sprayer. Pump to the pressure you will use during the pesticide application.
2. Spray to determine width of swath (in metres).
3. Walk at a steady pace for 15 seconds. Measure the distance (in metres).
4. Multiply spray width times distance travelled to provide the area (in square metres) sprayed in 15 seconds.
5. Spray into a measuring device for 15 seconds – gives amount of solution sprayed in 15 seconds.
6. Application rate (L/ha) =
$$\frac{\text{amount sprayed}}{\text{area (length} \times \text{width)}} = \frac{\text{L} \times 10,000}{\text{sq. metres}}$$

To convert the application rate of any pesticide to the amount required for a small area, follow this guide:

- 1 kg/ha = 10 grams/100 m²
- for liquid measure, 100 L/ha = 1 L/100 m²

(Source: Ontario Pesticide Education Program Manual 1995).

DETERMINING AMOUNT OF HERBICIDES NEEDED

Determining Amount of Product Per Hectare

Most rates suggested in this publication are given in terms of both active ingredients (common name) per hectare and product (TRADE NAME) per hectare. However, where the amount of active ingredient in the formulations varies considerably (for example, 2,4-D is available in concentrations of 100 g/L, 400 g/L, 500 g/L, etc.) The rate is given in terms of active ingredient only.

Note: Throughout the Crop Recommendations sections of this publication, the common name of each herbicide (its active ingredient) is printed in lowercase letters (e.g., atrazine, dicamba, glyphosate), whereas the product trade name (the name of the liquid or powder etc., inside the container as supplied by the manufacturer) is printed in capital letters (e.g., AATREX, BANVEL II, ROUNDUP ULTRA), and its formulation is listed within brackets following the trade name.

Determining Amount of Product Required Per Tankful

After determining how much commercial product is needed per hectare, calibrate the sprayer and determine the number of hectares each tank will cover. Determine the quantity of herbicide needed to add to the spray tank using the following formula:

$$\text{Product required/tank} = \frac{\text{hectares covered by tank}}{\times \text{product rate/ha}}$$

Sample calculations:

$$\begin{aligned} \text{(a) product/tank} &= 4.1 \text{ ha} \times 2.2 \text{ kg/ha} \\ &= 9.02 \text{ kg LOROX/tank} \end{aligned}$$

$$\begin{aligned} \text{(b) product/tank} &= 4.1 \text{ ha} \times 4.5 \text{ L/ha} \\ &= 18.45 \text{ L ATRAZINE/tank} \end{aligned}$$

Follow manufacturer's recommendations on mixing order and procedures.

MATERIALS, MIXING AND MIXTURES

Dry herbicide formulations include granules, soluble powders and wettable powders. Granules do not require prior mixing into a slurry. They are ready to be mixed in water. Soluble powders can be dissolved in water. Wettable powders will not dissolve but will form a suspension that requires constant agitation.

Liquid herbicide formulations either mix in water to form a solution or may be oil-based and form an emulsion that will require agitation.

Pesticide labels usually provide mixing directions for registered tank-mixes, often describing the order of mixing. Whenever a label provides mixing directions, they should be followed. Consult the package labels for information on the compatibility of different herbicide products as certain formulations may react when mixed together, resulting in materials with different properties and activities than the original ones. If the pH or hardness of the water needs to be adjusted, adjustments should be made prior to the addition of other spray material in the tank.

When the label does not provide mixing instructions for a registered tank-mix, pesticides should generally be mixed using the following procedure:

- Fill the spray tank with water to 1/2 of the total spray volume required and start agitation. Add the different formulation types in the order listed below, allowing time for complete mixing and dispersion after adding each product.
 1. dissolvable packs
 2. wettable powders
 3. water dispersible granules and dry flowables

- Maintain agitation and fill spray tank to $\frac{3}{4}$ of total spray volume. Then add:
 4. water-based solutions
 5. emulsifiable concentrates
 6. spray adjuvants
- Finish filling the spray tank to the required volume, maintain continuous agitation during mixing and final filling, and throughout application.

Mixtures of different herbicides or mixtures of herbicides with pesticides or foliar fertilizers should not be applied in a single application unless registered for use in this way.

Unless specifically mentioned in this publication, or on a herbicide label, the addition of a surfactant or a detergent to a spray solution is not recommended.

Where water is known to have an excessive salt content, compatibility of the water and the chemical at field strength should be tested first on a small scale. See note on Agitation in Care and Use of Equipment.

Application Indicators

Colourants/Foam Markers for Pesticides Application

Colourants added to the pesticide solution help show where pesticides have been applied. Foam marking systems help minimize overlap. Adding a colourant to the basal sprays of herbicides on cut stumps of woody plants helps assure thorough coverage without respraying. Water-soluble colourants can also be useful in lawn spraying. Examples of colourants are listed below.

- Blazon: blue, water soluble
- Bas-oil Red : red, oil soluble
- Dye Red Foam

Colourants are available through agricultural chemical dealers.

3. PRECAUTIONS WITH PESTICIDES

**Read the product label
before using a pesticide!**

**Review the Grower Pesticide
Safety Course Manual.**

Keep detailed spray records.

PESTICIDE REGULATIONS

Before a pesticide can be sold or used in Canada, it must be registered under the federal Pest Control Products Act (PCP Act). The PCP Act registration number on the front panel of the label identifies the pesticide and tells you that the pesticide is registered and can be legally used in Canada. It is an indication that the Pest Management Regulatory Agency (PMRA) completed their scientific review of this pest control product and found that the product has value and that the potential hazards to the environment and human health were assessed and found acceptable when following the label directions.

The pesticide label is a legal document. It tells you how the pesticide can be legally used. Off-label use is illegal. It is against the law to use the pesticide in any other way or on any other crop or pest. You can find the labels for all registered pesticides on the PMRA website: www.pmr-arla.gc.ca.

For more information about pesticide regulations, refer to:

- Inside front cover of this publication
- PMRA website: www.pmr-arla.gc.ca
- PMRA Pest Management Information Service: 1-800-267-6315 (within Canada) or 1-613-736-3799 (outside of Canada)
- Ontario Ministry of the Environment (MOE) website at www.ene.gov.on.ca
- Your regional MOE Pesticides Specialist. See Appendix D. *Ontario Ministry of the Environment Pesticide Control Offices* on page 368

Pesticide Application Information

Read the pesticide label thoroughly before application. The label provides important information, such as:

- directions of use (rates of application, crops it can be used on, target pests, crop rotation restrictions, total number of applications)
- personal protective equipment that should be worn
- health hazards and toxicity
- re-entry intervals
- buffer zones
- special warnings
- steps to be taken, in case of an accident
- disposal

For more information on hazards, check the Material Safety Data Sheet (MSDS) or contact the manufacturer. Another resource for pesticide application information is the Ontario Pesticide Education Program's Grower Pesticide Safety Course Manual.

Re-Entry Intervals

The re-entry interval, also referred to as **Restricted Entry Interval (REI)**, is the period of time following a pesticide application during which workers must not enter the treatment area without wearing protective clothing and personal protective equipment. This allows any pesticide residue and vapours to dissipate from the field, preventing the possibility of inadvertent pesticide poisoning.

Health Canada reviews each pesticide to determine whether the label should include a specific re-entry interval. If no re-entry interval is stated on the label, assume that the spray solution must be dry before re-entry can occur. Some pesticides have labels that carry a warning about working in treated crops. Follow the label recommendations.

Days To Harvest (preharvest intervals (PHI), pregrazing and feeding intervals)

These intervals state the minimum time that must pass between the last pesticide application and the harvesting of the crop, or the grazing or cutting of the crop for livestock feed. If you harvest a crop before the preharvest interval has passed, there may be pesticide residues in excess of the Maximum Residue Limits (MRL) set by Health Canada.

To avoid exceeding the Maximum Residue Limits, always follow the directions on the label.

PROTECT THE ENVIRONMENT

Protect Water Sources

Mix pesticides and load the sprayer away from any water supply, including wells, ponds or streams.

Clean your spray equipment away from wells, ponds, streams and ditches. Apply the diluted rinse water to the treatment area (crop).

Use an anti-backflow device to prevent back-siphoning if you must take water from wells, ponds, streams or other sources.

Sweep granular pesticides off driveways and hard surfaces, back into the treated area, to prevent them from contaminating water sources.

Setback Distances for Water Bodies

It is an offence under the federal *Fisheries Act* to introduce any material into water that may be harmful to fish or fish habitat. To protect these waters, applicators must determine a suitable setback distance between the area to be protected and the area where pesticide treatments are planned. The protected area includes the water body as well as adjacent riparian (riverbank) areas that contribute to fish food and habitat.

Prevent Bee Poisoning

It is important to protect bees when you spray. Honeybees, as well as other bees and insects, are important pollinators of crops. Many crops also offer bees important sources of nectar for honey production.

Most organophosphate and carbamate insecticides are highly toxic to bees. Read each pesticide label for specific precautions regarding bees.

Manage Drift

- Do not spray when wind speeds are high or gusty.
- Read the product label for information regarding buffer zones, sprayer output (water volume) and recommended nozzles.
- Use the recommended sprayer output (L/ha).
- Use the most appropriate nozzle for the type of application. Where practical, use air induction/venturi nozzles. These nozzles significantly reduce drift when compared to conventional nozzles.
- Check the height of the boom to the target. Minimize the distance as much as possible.
- Do not apply pesticides if the wind is blowing towards susceptible crops or environmentally sensitive areas such as watercourses.
- Use spray plume protection where practical or available (hoods, shrouds, screens and air curtains).
- Use drift-reducing adjuvants in the spray tank as directed by the label.
- Use wick weeders, instead of spraying, when possible.
- Use non-volatile pesticides.

For more information about spray drift:

- OMAFRA/Agriculture and Agri-Food Canada booklet *BMP 13, Best Management Practices – Pesticide Storage, Handling and Application*
- Ontario Pesticide Education Program (Ridgetown College) videos *How to Manage Spray Drift* and *Spray Drift Reduction Through Air Induction*. Order videos on-line at www.opep.ca/Educational/EducationalMaterials.htm

Buffer Zones

Leave a suitable **buffer zone** between the treatment area and adjacent sensitive areas. Buffer zones are areas left untreated to protect an adjacent sensitive area, aquatic system or natural habitat.

Adjacent sensitive areas include cultivated plants grown for human consumption, plants sensitive to herbicide drift, trees or shrubs that may be damaged by herbicides leaching to roots, and areas where children play.

Aquatic systems include lakes, reservoirs, streams, creeks, ditches, marshes, wetlands, ponds, well heads, commercial fish ponds, etc.

Natural habitats include hedgerows, grasslands, shelterbelts, windbreaks, woodlots, vegetative strips, etc.

Some pesticide labels specify buffer zone requirements.

PESTICIDE DISPOSAL

Empty Pesticide Containers

Never reuse empty containers on the farm.

The **Ontario Pesticide Container Recycling Program** is available to growers and commercial applicators. Through this program, **clean, triple rinsed, plastic/metal pesticide containers** (up to 23 litres for plastic and 20 litres for metal) can be returned to Pesticide Container Depots located throughout the province. To locate the Pesticide Container Recycling Depot closest to you, call the Ontario Pesticide Education Program at 1-800-652-8573.

Surplus Spray Mix

The best way to dispose of any excess spray mix is to find other fields that require an application of this pesticide. Before spraying, check the label to make sure the pesticide is registered for use on that crop.

If you cannot find another field to spray, then dilute the remaining spray mix by adding **10 parts of water for each 1 part of spray mix**. This diluted solution can be safely applied to the treated area as long as you do not exceed the pesticide rate recommended on the label. Be sure to check the label for any restrictions about crop rotation, days to harvest or surplus spray mix disposal.

Never re-spray the treated field with undiluted spray mix. Spraying an area twice will double the recommended pesticide rate. This may cause illegal pesticide residues in the harvested crop or harmful residues in the soil that can cause crop damage.

Surplus Pesticides in Storage

If you have pesticides that you don't need or can't use, be sure to dispose of them safely.

Contact the supplier. It is sometimes possible to return unused pesticide if it is still in its original container.

If you cannot find any way to use the product as shown on the label, then the waste must be disposed of by waste haulers licensed under Part V of the *Environmental Protection Act* to carry hazardous wastes. Look in the Yellow Pages of your telephone directory under "Liquid Waste Removal". Watch your local paper for "Obsolete Pesticide Collection Days".

Emergency Procedures for Pesticide Poisoning and First Aid Information

See inside back cover.

Storing Pesticides

Ontario's Pesticides Act and Regulation 914 give storage requirements for storage facilities. The storage requirements that must be followed depends on which schedules of pesticides that you store.

For more information about storing pesticides:

- OMAFRA Factsheet *Pesticide Handling Facility*, Order No. 94-037
- Ontario Pesticide Education Program (Ridgetown College) Grower Pesticide Safety Course Manual

PESTICIDE SPILLS

If a pesticide spill causes, or is likely to cause, an adverse effect, you must notify the Ministry of the Environment Spills Action Center at 1-800-268-6060 (24 hours a day, 7 days a week) and your municipality (Regulation 914, s. 29).

Protect yourself before beginning to clean up any spill. Clean up spills immediately.

In the case of **minor spills**:

- For liquids, cover the spill with a thick layer of absorbent material such as kitty litter, vermiculite or dry soil. Sweep or shovel the material into a waste drum.
- For powders and granular, sweep or shovel the material into a waste drum.

In the case of a **major spill**:

- Remove any people or animals from the spill area. Stop the spill from spreading. Do not let the pesticide enter any watercourse.

For information on preventing spills, see the OMAFRA Factsheet *Ways to Avoid Pesticide Spills*, Order No. 96-025.

FOOTNOTES: Mention of a brand or trade name in this table does not constitute a guarantee or warranty of the product by the Ontario Weed Committee. Neither does this use signify that these products are approved to the exclusion of the comparable products. All trade names are capitalized.

* Various manufacturers.

† Indicates herbicides sold as a co-pack under this trade name.

Formulation Abbreviations

DC = dispersible concentrate
DF = dry flowable
DG = dry granules
DS = dry soluble
EC = emulsifiable concentrate
EM = emulsion

FI = flowable
Gi = gel
Gr = granular
Li = liquid
ME = microencapsulated suspension

OD = oil dispersible
PE = pellets
PS = pressurized spray
SC = soluble concentrate
SG = soluble granules

Sn = solution
SP = soluble powder
Su = suspension (flowable)
WG = wettable granules
WP = wettable powder

Winter Storage

- A – Do not allow to freeze.
- B – Preferably should not freeze. If frozen, return to original state by allowing product to warm to 10°C–20°C and agitate thoroughly before use.
- C – Not usually damaged by freezing. Store in a cool, dry place.
- D – Do not allow to freeze – store above 10°C.
- E – Do not allow to freeze – store above 4°C (this applies to the AMITROL 240).

Manufacturer Agent Code

See Appendix H, *Herbicide Companies and Agents*, on page 374. Phone numbers and websites are also listed.

CRITERIA FOR ONTARIO CLASSIFICATION OF PESTICIDE PRODUCTS

Sch.	Pesticide Category	Criteria	Sales Outlet	Used By
1	Restricted	Extremely Toxic, Very Highly Persistent	Licensed, Record of Sale	Licensed Applicator, Certified Agriculturist, under Permit Approval
2	Pest Control Industry and Agriculture	Very Toxic, Highly Persistent	Licensed, Record of Sale	Licensed Applicator or Certified Agriculturist
3	Consumer, Pest Control Industry and Agriculture	Moderately Toxic, Moderately Persistent	Licensed	Homeowner, Licensed Applicator and Agriculturist
4	Consumer, Pest Control Industry and Agriculture	Slightly Toxic	No License Required	Homeowner, Licensed Applicator and Agriculturist
5	Agriculture	Extremely Toxic, Very Highly Persistent	Licensed, Record of Sale	Same as Schedule 1 except no permit if Certified Agriculturist or Licensed Applicator
6	Consumer, Pest Control Industry, Commercial and Agriculture	Slightly Toxic	Licensed (same as Schedule 4 except larger container)	Homeowner, Licensed Applicator and Agriculturist

NOTES ON HERBICIDES

Read these notes together with the recommendations given later in this publication. Additional information on use, toxicity and safety precautions is given here. With a few exceptions, the herbicides are listed under their common (generic) rather than their trade or product name. See Table 4-1, *Herbicides Used in Ontario*, page 21, to determine the corresponding common name for a particular trade name. For example, Table 4-1 indicates that the trade name AATREX has a common name of atrazine; notes on AATREX are listed under atrazine in this section. See Chapter 5, *Notes on Adjuvants*, page 67, for information on adjuvants.

Complete information on each herbicide is available on the product label located on the herbicide container. The federal Pest Management Regulatory Agency also lists pesticide labels on their Internet website www.pmr-a-rla.gc.ca. Many herbicide manufacturers also list product labels and/or Material Safety Data Sheets (MSDS) on their websites listed on the last page of this publication.

2,4-D

Trade Names: 2,4-D AMINE 500, 2,4-D ESTER 600, 2,4-D ESTER 700, SALVO 2,4-D ESTER 700.

Chemical Family: Phenoxy.

Crop and/or Non-Crop Registrations: Cereals, turf, pastures, non-cropland, asparagus, field corn, cranberries, raspberries, strawberries, bearing fruit trees including apple, pear, peach, plum, apricot and cherries, water weeds and brush.

Sensitive Weeds: Most broadleaf weeds and brush.

Uptake and Translocation: Readily absorbed through leaves or roots. Translocated primarily in phloem with the sugars but can also move with water in the xylem. Accumulation is primarily in the young, rapidly growing meristematic regions of roots or shoots.

Basis of Selectivity: Differences in interception, penetration, translocation, metabolism and sensitivity of active sites lead to greater activity on broadleaf weeds compared to grasses.

Application Methods: Postemergence (broadleaf weeds), stem-foliage or stem-basal (brush).

Residual Activity: Half-life in soil is usually not longer than 1 or 2 weeks during the growing season due to rapid decomposition by soil micro-organisms.

Unique Characteristics: All weeds are more easily killed when growing rapidly in moist soil. Unfortunately, some broadleaf crops, garden and ornamental plants are as sensitive to 2,4-D as many weeds and only a trace of the chemical as spray drift, vapour drift or contaminant in soil or water may cause serious damage. Even crops that can be sprayed safely can be sensitive at some stages of growth or at excessive application rates; thus follow label precautions carefully. Amines and esters are the most common formulations of 2,4-D. The esters are the most active and can be used at the lower rates and for brush control. Since vapour drift is a potential problem with the ester formulations, use only amines on lawns, or near gardens or susceptible crop areas. Low-volatile esters can be used by agriculturists or licensed applicators in areas where risk of damage to sensitive non-target vegetation is low. Recommendations are on the basis of acid equivalent; commercial products differ in their content of acid equivalent, which must be considered in determining the amount of product to use.

2,4-D/DICAMBA/MECOPROP-P

Trade Names: KILLEX, PAR III, PREMIUM 3-WAY XP, TRI-KIL, TRILLION-PLIQUID TURF HERBICIDE, WEEDAWAY XP TURF HERBICIDE.

Chemical Family: Phenoxy/benzoic acid/phenoxy.

Crop and/or Non-Crop Registrations: Turf.

Sensitive Weeds: At field-crop rates: wild buckwheat, lady's-thumb, green smartweed, Russian thistle, sow-thistle, hedge bindweed, corn spurry, knotweed, volunteer cultivated buckwheat, common ragweed, cocklebur, stinkweed, mustards, prostrate pigweed, redroot pigweed and lamb's-quarters. At non-crop-land rates, a wide range of broadleaf weeds including bull thistle, chicory, goat's beard, ragwort, white cockle, poison-ivy, alder and sheep-laurel.

Application Method: Postemergence when weeds are small and actively growing.

Unique Characteristics: This mixture controls a wider spectrum of weeds than any of the herbicides alone.

2,4-DB

Trade Names: COBUTOX, EMBUTOX, CALIBER.

Chemical Family: Phenoxy.

Crop and/or Non-Crop Registrations: Seedling alfalfa, bird's-foot trefoil, clovers (except sweet) direct seeded or underseeded in spring wheat, barley or oats; corn.

Sensitive Weeds: Many small broadleaf weeds such as stinkweed, ragweed, lamb's-quarters, wild buckwheat and mustards. Top-growth control of Canada thistle, field bindweed and perennial sow-thistle.

Uptake and Translocation: Absorbed through the foliage and readily translocated to the growing points.

Basis of Selectivity: Sensitive weeds rapidly convert 2,4-DB into 2,4-D; tolerant species do not make this conversion under normal conditions.

Application Method: Postemergence.

Residual Activity: None.

Unique Characteristics: Mustards are not usually controlled by 2,4-DB alone if sprayed beyond the 4-leaf stage; a tank-mixture with MCPA will improve control of these larger mustards. Injury to alfalfa

increases under drought stress or when alfalfa seedlings have more than 4 leaves.

ACETIC ACID

Trade Name: ECOCLEAR.

Chemical Family: Unknown.

Crop and/or Non-Crop Registrations: Non-crop, right-of-way and industrial land sites.

Sensitive Weeds: Annual broadleaf and grassy weeds including ragweed, chickweed, lamb's-quarters and black medic. Suppression of perennial weeds including dandelion, plantain spp., clover spp., wild carrot, toadflax, quack grass, tufted vetch, hawkweed spp. and curled dock.

Basis of Selectivity: Non selective.

Application Methods: Postemergent spray when weeds are small and actively growing. EcoClear is a contact herbicide, thorough coverage is necessary to achieve desirable control. EcoClear can be used as a spot treatment or as a broadcast application. For broadcast application apply 750–1250 L of final solution/ha.

Residual Activity: Non-residual.

Unique Characteristics: ECOCLEAR works very quickly. Complete control can be achieved in as little as 24 hours. Weeds that are mature, dormant or hardened due to moisture stress tend to be more tolerant to treatment with ECOCLEAR.

ACIFLUORFEN

Trade Name: BLAZER.

Chemical Family: Diphenyl ether.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Annual broadleaf weeds including: cocklebur, jimsonweed, lady's-thumb, lamb's-quarters, wild mustard, redroot pigweed, common ragweed and eastern black nightshade. Suppression of perennial weeds including: Canada thistle, hedge bindweed, field bindweed and common milkweed.

Uptake and Translocation: Taken up through the foliage. Not readily translocated.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence when weeds are small and actively growing. Apply in 200–400 L/ha of water with a pressure of 275–400 kPa. Soybeans are tolerant after the first trifoliolate-leaf stage. Thorough coverage is necessary. The use of flat fan nozzles is recommended. Do not add adjuvants to acifluorfen applied at the full rate. BASAGRAN may be tank-mixed with acifluorfen for control of additional broadleaf weeds including velvetleaf. When tank-mixing BASAGRAN and acifluorfen, it is recommended to add 1 L/ha of ASSIST OIL CONCENTRATE.

Residual Activity: Essentially none.

Unique Characteristics: Acifluorfen is not volatile. Significant crop injury can be expected if acifluorfen is applied during hot, humid weather or if the crop is stressed due to previous herbicide injury, flooding, drought or cold conditions prior to the application. Cool weather or drought may delay control. Rainfall within 6 hours after application may reduce effectiveness. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

ADJUVANT

See Chapter 5, *Notes on Adjuvants*, page 67.

AMINOPYRALID

Trade Name: MILESTONE HERBICIDE.

Chemical Family: Pyridine.

Crop and/or Non-Crop Registrations: Rangeland, grass pastures, industrial and other non-crop areas of Canada.

Sensitive Weeds: MILESTONE used alone controls: Canada thistle, spotted knapweed, Canada goldenrod, scentless chamomile, absinth wormwood, common tansy. MILESTONE can be tank mixed with 2,4-D amine for control of western snowberry, dandelion, annual sow thistle, bluebur, bull thistle, burdock, buttercup, cocklebur, common plantain, curled dock, flaxweed, Goat's beard, hawkweed, hoary cress, peppergrass, perennial sow thistle,

prickly lettuce, stinging nettle, sweet clover and wild carrot.

Uptake and Translocation: Herbicide taken up primarily through the foliage, but also has soil residual activity on roots, seedlings and seeds. Strong translocation.

Basis of Selectivity: Metabolized by tolerant species.

Application Methods: Postemergence when weeds are small and actively growing. Apply with ground equipment in minimum of 100 L/ha or aerial equipment in a minimum of 19 L/ha spray volumes. Good coverage is necessary.

Residual Activity: Short term soil residual activity that will control most species for two years.

Unique Characteristics: MILESTONE has no grazing restriction on livestock or lactating dairy animals grazing in treated areas. Allow 3 days of grazing on untreated pasture or untreated hay before transferring livestock to areas where sensitive broadleaf crops may be grown. Do not move manure compost containing MILESTONE onto sensitive crops, flowers, gardens, etc. Use only on well established forage grasses (secondary root development). MILESTONE Herbicide will kill legume plants (including alfalfa and clover in tame pastures). Use adequate buffer zones from sensitive crops and do not allow product spray to drift off site onto sensitive crops. Do not plant legumes crops on treated land for 48 months after application. Clean spray equipment thoroughly after use, before using spray equipment for other applications to sensitive crops. MILESTONE Herbicide cannot be applied on domestic or commercial turf grass. Rainfast period is 2 hours.

AMITROLE

Trade Name: AMITROLE 240.

Chemical Family: Triazole.

Crop and/or Non-Crop Registrations: Preplant in wheat, barley, canola, field peas, corn, soybeans and white beans. Postharvest after any crop. In-season weed control in apples. Use in shelterbelts, non-crop areas, marshes and ditches. Spot treatment in pastures.

Sensitive Weeds: Many annual and perennial broadleaf weeds and grasses including quack grass, dandelions, Canada thistle, sow-thistle, poison-ivy, poison-oak, toadflax, milkweed, hoary cress, leafy spurge, horsetail, cattail, honeysuckle, locust, ash and sumac.

Uptake and Translocation: Absorbed by foliage and roots. Translocates well in xylem and phloem. Accumulates in growing regions of plant.

Basis of Selectivity: Resistant plants metabolize amitrole more rapidly than sensitive plants and may have lower uptake as a result of leaf structure that reduces wetting and penetration.

Application Methods: Foliar postemergence application to actively growing plants. Good coverage is essential. If weeds are mature, it is advisable to cut them and then spray the regrowth. Do not disturb treated plants for at least 2 weeks after application. Do not make postharvest application after Oct. 1. For control of quack grass and Canada thistle, apply in spring or fall to actively growing plants 15–20 cm tall; wait 10–14 days and then plough or disk.

Residual Activity: Approximately 2–4 weeks in moist, warm soil.

Unique Characteristics: Most crops are sensitive if contacted. Poor results may occur if spray coverage is inadequate, if plants are drought stressed or over-mature, or if heavy rains fall within 6 hours after application. Do not graze or plant to grain, peas, alfalfa or clover for 8 months after treatment. Do not graze spot-treated areas in pastures for 6 months following treatment.

ATRAZINE

Trade Names: AATREX LIQUID 480, ATRAZINE 480, CONVERGE 480.

Chemical Family: S-triazine.

Crop and/or Non-Crop Registrations: Corn (ensilage, field, seed and sweet), lowbush blueberries and triazine-tolerant canola (rapeseed).

Sensitive Weeds: Will control a wide range of broadleaf weeds such as mustards, purslane, ragweed, smartweed, lady's-thumb, wild buckwheat, lamb's-quarters, pigweed and volunteer clover. Populations of

lamb's-quarters, pigweed and ragweed have been found that are resistant to atrazine and are therefore not controlled.

Uptake and Translocation: Actively absorbed by roots and foliage, although foliar absorption is usually small. It is translocated to the top of the plant and accumulates in the leaf margins and the growing points.

Basis of Selectivity: Metabolism by tolerant species. Spray timing avoids contact with lowbush blueberries to prevent injury.

Application Methods: For corn, preplant incorporated, preemergence, or postemergence (with or without oil) usually before the annual weeds are more than 4 cm high; under dry weather conditions a shallow incorporation may enhance activity; oil or oil/surfactant blends will increase the postemergence activity. For lowbush blueberries, preemergence application. For triazine-tolerant canola, postemergence. Dry bulk fertilizer may be impregnated with atrazine and applied preplant incorporated. Atrazine may be tank-mixed with several other annual grass and broadleaf herbicides to increase the spectrum of weed control in corn.

Residual Activity: Can persist in the soil for varying lengths of time depending on rate, weather and soil conditions (longer under dry, cool weather conditions and in sandy soils). Postemergence treatments tend to persist longer than preemergence treatments. See section *Special Notes for Corn*, page 120.

Unique Characteristics: Atrazine may carry over for more than 1 planting season. One year after application there is usually no hazard to most rotational crops when 1.5 kg ai/ha or less is applied. Cool, dry weather and sandy soils are conditions under which problems may arise. See *Notes on Atrazine and Simazine Soil Residues*, page 120.

ATRAZINE/2,4-D

Trade Name: SHOTGUN.

Chemical Family: Triazine/phenoxy.

Crop and/or Non-Crop Registrations: Field corn.

Sensitive Weeds: Lady's-thumb, lamb's-quarters, wild mustard, redroot pigweed, common ragweed, velvetleaf, wild buckwheat; tank-mix with pendamethalin+rimsulfuron, nicosulfuron, rimsulfuron or nicosulfuron/rimsulfuron for control of barnyard grass, green foxtail and yellow foxtail; tank-mix with rimsulfuron or nicosulfuron/rimsulfuron for control of fall panicum.

Uptake and Translocation: Both components may be taken by either roots or shoots, but the atrazine will primarily be absorbed by the roots and travel in the transpiration stream, while the 2,4-D will primarily be absorbed by the shoots and move in the phloem.

Basis of Selectivity: See notes on 2,4-D and atrazine.

Application Method: Postemergence.

Residual Activity: Injury may occur if land treated with atrazine/2,4-D is planted to any crop other than corn in the same season. Sensitive crops such as tobacco and sugar beets should not be planted in the year following treatment. When extended periods of dry weather occur during the year of treatment, there can be some injury to succeeding crops such as white beans, onions, peas, tomatoes and turnips. Injury is most likely to occur when the seedling crop is subjected to periods of stress, e.g., during periods of abnormally hot, dry weather.

Unique Characteristics: See the 2,4-D note for information about spray and vapour drift. See also *Notes on Atrazine and Simazine Soil Residues*, page 120.

BENSULIDE

Trade Name: BETASAN.

Chemical Family: Benzenesulfonamide.

Crop and/or Non-Crop Registrations: Lawns, turf and cucumbers.

Sensitive Weeds: Germinating annual grasses such as annual bluegrass, barnyard grass, crab grass and foxtail. Some control of redroot pigweed, lamb's-quarters and shepherd's-purse.

Uptake and Translocation: Adsorbed on root surfaces and a small amount is absorbed by the roots. Little or none is translocated upward to the leaves.

Basis of Selectivity: Inhibits root growth and partially inhibits cell division in sensitive seedlings. Sensitive species affected only in seedling stage. Metabolized by established grasses.

Application Methods: Preemergence in spring or fall for turf (well-established only); a higher rate is required for fall applications to control germinating weeds the following spring; incorporate by lightly irrigating into soil.

Residual Activity: Season-long weed control. Degraded slowly by soil micro-organisms with a half-life of 4–6 months depending on soil type. Because of soil residues, only cucurbits, cole crops, carrots, lettuce, peppers and tomatoes should be planted the following year.

Unique Characteristics: Bensulide is inactivated in soils containing high amounts of organic matter (muck soils). Incorporation recommended to avoid photodecomposition. Do not reseed lawn within 1 year of application. Formulations available with fertilizers for homeowner lawn use.

BENTAZON

Trade Names: BASAGRAN FORTÉ, BASAGRAN.

Chemical Family: Benzothiadiazine.

Crop and/or Non-Crop Registrations: BASAGRAN FORTÉ AND BASAGRAN: Peas, flax, soybeans, corn. BASAGRAN also registered for peanuts, lima beans, highbush blueberry, new plantings of apples, apricots, cherries, peaches, pears and turf. BASAGRAN FORTÉ AND BASAGRAN are registered for use on a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations.

Sensitive Weeds: Annual broadleaf weeds including hairy nightshade, lamb's-quarters, redroot pigweed, low cudweed, purslane, common ragweed, wild radish, Russian thistle, hairy galinsoga, corn spurry, bird rape, flower-of-an-hour, buttercups, common groundsel, jimsonweed, giant ragweed, velvetleaf,

lady's-thumb, wild mustard, cocklebur, stinkweed, shepherd's-purse and common chickweed. Triazine-tolerant biotypes of lamb's-quarters, redroot pigweed, common ragweed and common groundsel are also controlled. Top growth of Canada thistle and nut sedge are controlled. Field bindweed may be suppressed by 2 applications applied 10 days apart.

Uptake and Translocation: Taken up through the foliage. Not translocated.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence when weeds are small and actively growing. Apply in 100–400 L water/ha. Crop must be in a tolerant growth stage (see specific recommendations on label). Thorough spray coverage is necessary. Use flat fan nozzles tilted 45° forward. Use ASSIST OIL CONCENTRATE with BASAGRAN. Reduce the ASSIST rate under hot, humid conditions. Liquid ammonium sulphate or 28% urea ammonium nitrate may be added to BASAGRAN FORTÉ or BASAGRAN for improved and more consistent control of velvetleaf and lamb's-quarters in soybeans only. PINNACLE may be tank-mixed with BASAGRAN FORTÉ or BASAGRAN for improved pigweed and lamb's-quarters control in soybeans only. BASAGRAN FORTÉ does not require additional adjuvants. BASAGRAN FORTÉ is not registered for aerial application. BASAGRAN is registered for aircraft application for soybeans, dry and snap beans.

Residual Activity: Essentially none.

Unique Characteristics: Corn and turf are tolerant at all stages of growth. Bentazon is not volatile. Temporary crop injury can be expected if bentazon is applied during hot, humid weather or if crop is stressed (flooding, drought, cold). Cool weather or drought may delay control. Rainfall within 6–8 hours after application may reduce effectiveness. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

BENTAZON/ATRAZINE**Trade Name:** LADDOK.**Chemical Family:** Benzothiadiazine/s-triazine.**Crop and/or Non-Crop Registrations:** Corn (ensilage, field, seed and sweet).**Sensitive Weeds:** Annual broadleaf weeds such as black nightshade, redroot pigweed, lamb's-quarters, low cudweed, purslane, common ragweed, Russian thistle, corn spurry, flower-of-an-hour, lady's-thumb, wild mustard, hairy galinsoga, bird rape, buttercup, common chickweed, common groundsel, jimsonweed, giant ragweed, velvetleaf and cocklebur. Triazine-tolerant biotypes are also controlled. Top growth of Canada thistle and nut sedge are controlled. Field bindweed may be suppressed.**Uptake and Translocation:** Uptake into the plant occurs primarily through the leaves. Bentazon/atrazine has mainly contact action and translocation is minimal.**Basis of Selectivity:** Metabolism by tolerant species.**Application Methods:** Apply Bentazon/atrazine early postemergence when weeds are small and actively growing. Apply in 200–400 L water/ha. Apply before weeds reach the maximum size listed on the label. This generally corresponds to corn in the 1 to 5-leaf stage. Under good growing conditions, the most effective time for spraying will usually be 18–28 days after planting. Add ASSIST OIL CONCENTRATE to the spray tank for all applications. Thorough spray coverage is important and use flat fan nozzles. The use of flooding nozzles is not recommended because of inadequate coverage.**Residual Activity:** Injury may occur to any crop other than corn planted in the same season on land treated with bentazon/atrazine. In the season after application, there is virtually no hazard to most rotational crops when label rates for annual weed control have been used. Overlap or the use of a double application for nut sedge control may result in injury to rotational crops due to carry over of the atrazine component of bentazon/atrazine.**Unique Characteristics:** Corn is tolerant at all stages of growth. Rainfall within 6–8 hours of application

may reduce effectiveness of the spray solution. Bentazon/atrazine is not volatile but it should not be applied when crop is under stress from prolonged cold, wet weather, poor fertility or other factors.

BROMACIL**Trade Names:** HYVAR X-L.**Chemical Family:** Uracil.**Crop and/or Non-Crop Registrations:** Non-cropland for total vegetation control and as a spot treatment to control brush.**Sensitive Weeds:** Annual and perennial broadleaf weeds and grasses (broadcast application). Several brush species (spot application).**Uptake and Translocation:** Most readily absorbed through the roots. Surfactants can enhance foliar activity. Translocation is upward with the movement of water to leaves where it inhibits photosynthesis.**Basis of Selectivity:** Non-selective at normal rates.**Application Methods:** For herbaceous weeds, broadcast sprayed, preferably just before or during periods of active weed growth. For brush, spot applications with an exact-delivery handgun sprayer either at the base of target brush or on a grid.**Residual Activity:** Half-life was 5–6 months for 4.4 kg/ha bromacil in a silty loam soil.**Unique Characteristics:** Do not use Bromacil where it is likely to leach, wash or move with eroded soil into contact with the roots of desirable trees and shrubs. Do not apply to brush standing in water.**BROMACIL/DIURON****Trade Name:** KROWAR.**Chemical Family:** Uracil/substituted urea.**Crop and/or Non-Crop Registrations:** Non-cropland.**Sensitive Weeds:** Most herbaceous weeds.**Basis of Selectivity:** Non-selective.**Application Method:** Broadcast sprayed just before or during the period of active weed growth.**Unique Characteristics:** Normally fewer species of weeds escape or regrow after use of this mixture compared to use of the same amount of either

chemical alone. Also see notes on BROMACIL and DIURON.

BROMOXYNIL**Trade Name:** PARDNER, KORIL.**Chemical Family:** Hydroxybenzonitrile.**Crop and/or Non-Crop Registrations:** Spring wheat, barley, oats, corn, fall rye, triticale, forage sorghum and millet, and many other grasses, garlic, dry bulb onions.**Sensitive Weeds:** Smartweed, nightshade, velvetleaf, pigweed, common ragweed, cocklebur, stinkweed, and wild mustard are killed if the chemical thoroughly contacts these plants before they have more than 4 true leaves; wild buckwheat and lamb's-quarters control to 8 leaf. Most established perennial broadleaf weeds, chickweed and grasses tolerate field applications of this herbicide.**Uptake and Translocation:** Absorbed by plant foliage and moves very little within the plant.**Basis of Selectivity:** Differential spray retention, uptake, translocation and degradation.**Application Method:** Postemergence.**Residual Activity:** Essentially no soil residual activity.**Unique Characteristics:** Crop injury symptoms (leaf scorch) may develop if the plant is under stress within 2 or 3 days before or after spraying; this stress could be caused by high temperatures or high humidity or, in the case of corn, application following a period of cool, wet weather; such injury usually does not affect yields. The formulation includes a wetting agent to improve the spread of droplets on the leaf. Although bromoxynil is not an effective soil-applied herbicide, broadleaf crops such as turnips, peas and beans should not be seeded for a week after spray application.**BROMOXYNIL/MCPA****Trade Names:** BADGE, BUCTRIL M, MEXTROL.**Chemical Family:** Hydroxybenzonitrile/phenoxy.**Crop and/or Non-Crop Registrations:** Spring and winter wheat, barley, oats, flax, fall rye, corn, timothy hay and canary grass.

Unique Characteristics: Combination of bromoxynil with MCPA provides better control of mustards than bromoxynil alone. Also see notes on BROMOXYNIL and MCPA.

CARFENTRAZONE-ETHYL

Trade Name: AIM EC.

Chemical Family: Aryl triazolinone.

Crop and/or Non-Crop Registrations: Preplant burn-down (all crops except tobacco, asparagus, ginseng, nursery stock and turfbeds); hooded sprayer applications (for use in root, tuber, bulb, legume, fruiting and leafy vegetables, pome & stone fruits and berries – refer to product label for specific crop registrations); harvest aid treatment for potatoes, dry beans, soybeans and cereals.

Sensitive Weeds: Broadleaf weeds.

Uptake and Translocation: Carfentrazone-ethyl is taken up through the foliage and not readily translocated.

Basis of Selectivity: Metabolism.

Application Methods: Coverage of the weeds is essential for good control. Dessication – when the crop is mature and the grain has begun to dry down.

Residual Activity: None.

Unique Characteristics: AIM EC is a non-residual product and will not injure subsequent crops.

CARFENTRAZONE-ETHYL + GLYPHOSATE

Trade Name: CLEANSTART PLUS (co-pack of AIM EC + CREDIT PLUS).

Chemical Family: Aryl triazolinone + Amino acid.

Crop and/or Non-Crop Registrations: Preplant burn-down (all crops except tobacco, asparagus, ginseng, nursery stock and turfbeds).

Sensitive Weeds: Annual and perennial broadleaf and grass weeds.

Uptake and Translocation: Refer to notes on carfentrazone-ethyl and glyphosate.

Basis of Selectivity: Refer to notes on carfentrazone-ethyl and glyphosate.

Application Methods: Refer to notes on carfentrazone-ethyl and glyphosate.

Unique Characteristics: Refer to notes on carfentrazone-ethyl and glyphosate.

CHLORIMURON-ETHYL

Trade Name: CLASSIC.

Chemical Family: Sulfonylurea.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Common ragweed, redroot pigweed, and velvetleaf.

Uptake and Translocation: Following foliar application, chlorimuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert chlorimuron to non-phytotoxic metabolites.

Application Methods: Postemergence.

Residual Activity: Chlorimuron will provide some limited residual activity after application.

Unique Characteristics: A non-ionic surfactant must be added at 0.2% v/v. 28% Urea ammonium nitrate (U.A.N.) at 2 L/ha will improve the control of velvetleaf. Typical symptoms of plant death (chlorosis, necrosis) may occur from 1–3 weeks after application, depending on growing conditions. Favourable growing conditions will speed the activity while cool or dry conditions will delay activity.

CHLORPROPHAM

Trade Names: CIPC EC, CIPC GR, CIPC.

Chemical Family: Phenylcarbamate.

Crop and/or Non-Crop Registrations: Carrots, lettuce, onions, spinach, daffodils, gladioli, iris, tulips and ornamental nursery stock.

Sensitive Weeds: Annual broadleaf and grass weeds including purslane, chickweed, smartweed, carpetweed, false flax, annual bluegrass, crab grass, rye grass, stink grass and dodder.

Uptake and Translocation: Readily translocated to the leaves following root absorption. Vapours have been

demonstrated to be absorbed by seeds and emerged dodder.

Basis of Selectivity: Rapid degradation in tolerant plants as well as soil adsorption.

Application Methods: Preemergence and directed postemergence in specified crops.

Residual Activity: Tightly bound to soil colloids. The rate of dissipation can vary greatly with microbial activity and moisture level. Both high soil temperature and excessive soil moisture increase the rate of dissipation.

Unique Characteristics: Use the lower rates on sandy or coarse-textured soils and the higher rates on clay or muck soils. Weed control is most effective when soil temperatures are below 16°C. The lower rate should be used when soil temperature is below 16°C. The soil must be moist for effective weed control.

CHLORSULFURON

Trade Name: TELAR.

Chemical Family: Sulfonyl urea.

Crop and/or Non-Crop Registrations: Non-cropland.

Sensitive Weeds: Annual and perennial broadleaf weeds such as wild carrot, Canada thistle, sow-thistle, scentless chamomile, lamb's-quarters, wild mustard, redroot pigweed, stinkweed, cow cockle, chickweed and Russian thistle.

Uptake and Translocation: Thoroughly systemic after absorption of either foliage or roots. Foliar absorption is rapid.

Basis of Selectivity: A disruption of amino acid metabolism leads to an inhibition of cell division in sensitive plants. Faster rates of metabolic detoxification have been observed in tolerant species.

Application Methods: Preemergence or early postemergence.

Residual Activity: Half-life is 4–6 weeks under growing season conditions. Degradation is faster with higher soil temperatures and/or lower soil pH.

Unique Characteristics: Although degradation is moderately rapid, extremely low residues can be highly toxic to some broadleaf weeds, such as wild carrot,

for up to 2 years after application. Use of this product requires a surfactant.

CHLORTHAL DIMETHYL

Trade Name: DACTHAL W-75.

Chemical Family: Phthalate.

Crop and/or Non-Crop Registrations: Broccoli, Brussels sprouts, cabbage, cauliflower, dry and snap beans, eggplant, established ornamentals, garlic, turf, onions, peppers, potatoes, seeded melons, soybeans, strawberries, sweet potatoes, tomatoes, woody nursery stock.

Sensitive Weeds: Germinating annual grasses and certain annual broadleaf weeds such as lamb's-quarters, purslane, common chickweed, redroot pigweed, carpetweed and groundcherry.

Uptake and Translocation: Absorbed by roots but not foliage. Does not translocate within the plant.

Basis of Selectivity: Inhibits growth of germinating seeds; exact mechanism not yet known.

Application Method: Must be applied prior to weed seed germination. Depending on the crop, may be applied preplant incorporated, preemergence, postemergence or post transplant to crop. At least 1 cm of water as either rain or irrigation is necessary to activate the herbicide. In turf, spring or fall application is satisfactory.

Residual Activity: Average half-life is 100 days in most general soil types. Effective weed control may be maintained for as long as 2 months, depending on application rate and soil type.

Unique Characteristics: May be applied over the top of most plants with no phytotoxic effects. Has little herbicidal activity on velvetleaf, common ragweed, wild mustard, jimsonweed, galinsoga, smartweed, nutsedge and cocklebur. Established turf lawns (with the exception of the bent grasses) have good tolerance. Turf should not be reseeded for 60 days after treatment. Use only on mineral soils.

CLETHODIM

Trade Name: SELECT.

Chemical Family: Cyclohexanedione.

Crop and/or Non-Crop Registrations: Canola, flax, a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations, soybeans, sunflowers, dry onions, and potatoes.

Sensitive Weeds: Annual grasses (wild oats, green and yellow foxtail, volunteer cereals, volunteer corn and barnyard grass).

Uptake and Translocation: Uptake through the foliage and translocated through both the phloem and xylem throughout the plant accumulating in the meristematic regions both above and below the ground.

Basis of Selectivity: Tolerant plants rapidly metabolize clethodim to several conjugated metabolites.

Application Method: Postemergent to actively growing grasses in the 2-6 true-leaf stage.

Residual Activity: Rapid degradation in both soil and water with no soil activity.

Unique Characteristics: Highly active on all annual grasses and volunteer cereals at one low dose rate of 0.19 L/ha in a tank-mix with the adjuvant CC-16255.

CLOMAZONE

Trade Names: COMMAND 360 ME.

Chemical Family: Isoxazolidinone.

Crop and/or Non-Crop Registrations: Soybeans, Sweet Potatoes.

Sensitive Weeds: Velvetleaf, Lambsquarters, Lady's thumb, Eastern Black Nightshade, Barnyardgrass, Green Foxtail, Yellow Foxtail.

Uptake and Translocation: Primarily absorbed through the roots and is translocated through the xylem in the plant.

Basis of Selectivity: Clomazone is metabolized in soybeans.

Application Methods: Preemergence.

Residual Activity: When applied at recommended rates, Command 360 ME will provide season long weed control. It is relatively immobile in soil and microbial decomposition is the principle path of dissipation.

Some rotational restrictions apply, refer to Tables 4-3, page 60 and 4-4, page 62 for more information. Soil texture impacts residual and product efficacy, see product label for appropriate rates.

Unique Characteristics: Sensitive plants in the application zone will turn white (bleached) as carotenoid biosynthesis is inhibited.

CLOPYRALID

Trade Names: LONTREL 360, TRANSLINE.

Chemical Family: Pyridine.

Crop and/or Non-Crop Registrations: Strawberries, highbush blueberries, new and bearing apples, cranberries, sugar beets, rutabagas, cole crops (cabbage, cauliflower, broccoli, asian cole crops), canola, barley, oats, wheat, control of broadleaf weeds in rights-of-way (hydro, railroad, communication lines, pipelines) and associated stations, industrial manufacturing sites, storage sites and roadsides, airports, military bases and low maintenance, rough-turf areas, rangeland, grass pasture and balsam fir Christmas tree stands or plantations.

Sensitive Weeds: Will control or suppress certain annual and perennial weeds including Canada thistle, goldenrod, ox-eye daisy, tufted vetch, sheep sorrel, dandelion and wild buckwheat, scentless chamomile, groundsel, ragweed, coltsfoot and spotted knapweed.

Uptake and Translocation: Rapidly absorbed by foliage and translocated readily throughout the plant via both xylem and phloem systems. Clopyralid is distributed throughout the plant to the meristem.

Basis of Selectivity: Effects on nucleic acid metabolism and growth are not observed in grasses and other tolerant species.

Application Methods: Postemergence as a broadcast or selective foliar.

Residual Activity: Half-life in soil is less than 30 days under conditions that are favourable for microbial degradation. Little to no residual activity.

Unique Characteristics: Clopyralid has little to no activity on woody vegetation, except woody species of the legume family.

CLORANSULAM-METHYL

Trade Name: FIRSTRATE.

Chemical Family: Triazolopyrimidine sulfonanilide.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Common ragweed, giant ragweed, cocklebur, velvetleaf, and jimsonweed.

Uptake and Translocation: Absorption by roots, shoots and foliage. Translocation via the xylem and phloem and accumulation in the growing points.

Basis of Selectivity: Metabolism by soybeans. Inhibition of the acetolactase synthase (ALS) enzyme in susceptible plants followed by a rapid cessation of cell division and plant growth.

Application Methods: Preemergence in both conventional and conservation tillage systems or postemergence prior to the flowering stage of soybeans.

Residual Activity: Decomposition in soils is attributed primarily to microbial degradation. Some rotational cropping restrictions apply. Refer to Tables 4-3 and 4-4, *Herbicide Crop Rotation and Soil pH Restrictions*, on page 60, and page 62 for additional information.

Unique Characteristics: Do not apply to peat or muck soils. Preemergence or postemergence applications require an activating rainfall that moistens the soil to a depth of at least 5 cm in order to move FirstRate into the weed germination zone. If adequate rainfall is not received within 7–10 days after application, a shallow cultivation or use of a rotary hoe is recommended. Do not apply when air temperature is near freezing or when freezing conditions are expected for several days following time of application. Extended cold, wet conditions or abnormally high soil moisture conditions during emergence and early crop development may cause injury symptoms on soybeans such as temporary yellowing of the leaves and/or crop stunting. Soybeans will quickly outgrow these symptoms once normal growing conditions resume. Postemergence application prior to full emergence of the first trifoliate leaf may cause temporary yellowing of soybeans. This effect is transient and has no effect on soybean yields. Postemergence application requires the addition of a non-ionic sur-

factant (Agral 90) and a liquid ammonium fertilizer (28-0-0 or 32-0-0). See label for details.

COPPER SULPHATE

Trade Name: POLYDEX MC – no information provided to the Ontario Weed Committee, contact manufacturer for more information.

CORN GLUTEN MEAL

Trade Name: TURFMAIZE.

Chemical Family: TURFMAIZE is a non-chemical product.

Crop and/or Non-Crop Registrations: Established Kentucky Bluegrass.

Sensitive Weeds: inhibits germination of smooth crabgrass and dandelion.

Uptake and Translocation: Not available.

Application Methods: Applied before smooth crabgrass and dandelion germination to established Kentucky blue-grass turf in the spring, late summer or fall.

DAZOMET

Trade Name: BASAMID.

Chemical Family: Dithiocarbamate.

Crop and/or Non-Crop Registrations: Field and green-house vegetable seedbeds for eggplant, lettuce, pepper and tomato; fall treatment only of tobacco greenhouse seedbeds; field and greenhouse seed and planting beds for annual flowers; turf seedbeds.

Sensitive Weeds: Most germinating weed seeds.

Uptake and Translocation: Breaks down on contact with soil moisture and releases toxic gases that control germinating weed seeds.

Basis of Selectivity: Non-selective. Chemical must be completely dissipated from the seedbed before planting or injury may occur. Breaks down on contact with soil moisture and releases toxic gases that control germinating weed seeds.

Application Methods: Apply granular product to a well-worked seedbed and incorporate evenly. Seal soil immediately after incorporation by rolling and flooding or by covering with heavy polyethylene plastic and sealing edges. After a waiting period of

10–40 days, depending on soil temperature, aerate the soil. Conduct a safety germination test before using treated soil. Do not use when soil temperature is below 6°C.

Residual Activity: Depends on the rate applied, soil moisture and soil temperature. The gases are toxic to all growing plants and a safety germination test must be carried out to determine that the soil is safe for planting.

Unique Characteristics: Also controls unencysted nematodes and soil fungi.

DESMEDIPHAM

Trade Name: BETANEX.

Chemical Family: Phenylcarbamate/Phenylcarbamate.

Crop and/or Non-Crop Registrations: Sugar beets.

Sensitive Weeds: Redroot pigweed, lamb's-quarters and wild mustard. Other weeds like ragweed species, wild buckwheat, nightshade species, kochia, goosefoot and stinkweed will be controlled when application of desmedipham is made following treatment with another preplant or preemergence herbicide.

Uptake and Translocation: Desmedipham is readily absorbed by foliage where it inhibits photosynthesis in the chloroplasts of leaf cells.

Basis of Selectivity: Rapid metabolism in tolerant species.

Application Methods: Postemergence beginning at the 2 true leaf stage of sugar beets. Up to the 2- or 4-leaf stage of weeds depending upon species. Best control is exhibited on very small, actively growing weeds.

Residual Activity: Soil half-life of desmedipham is less than 1 month.

Unique Characteristics: Desmedipham may cause temporary growth retardation and/or chlorosis or tip-burn to sugar beets when applied to stressed plants. Normal growth is resumed in 10 days after application.

DESMEDIPHAM/PHENMEDIPHAM

Trade Name: BETAMIX.

Chemical Family: Phenylcarbamate.

Crop and/or Non-Crop Registrations: Sugar beets.

Sensitive Weeds: Pigweed species, lamb's-quarters, wild mustard, wild buckwheat, green and yellow fox-tail. Other weeds like ragweed species, nightshade species, kochia, goosefoot and stinkweed will be controlled when application of desmedipham/phenmedipham is made following treatment with another preplant or preemergence herbicide.

Uptake and Translocation: Desmedipham/phenmedipham is readily absorbed by foliage where it inhibits photosynthesis in the chloroplasts of leaf cells.

Basis of Selectivity: Rapid metabolism in tolerant species.

Application Methods: Postemergence beginning at the 2 true-leaf stage of sugar beets. Up to the 2- or 4-leaf stage of weeds depending upon species. Best control is exhibited on very small, actively growing weeds.

Residual Activity: Soil half-life of desmedipham is less than 1 month and of phenmedipham is 25–30 days.

Unique Characteristics: Desmedipham/phenmedipham may cause temporary growth retardation and/or chlorosis or tip-burn to sugar beets when applied to stressed plants. Normal growth is resumed in 10 days after application.

DICAMBA

Trade Names: BANVEL II, ORACLE, VANQUISH.

Chemical Family: Benzoic acid.

Crop and/or Non-Crop Registrations: Field corn, spring and winter wheat, spring barley, spring rye, oats, summer fallow and stubble, pastures, red fescue, lowbush blueberries and turf; non-crop areas such as roadsides, utility rights-of-way and railways.

Sensitive Weeds: Annual, perennial and biennial broadleaf weeds and numerous brush species including conifers. Effective against velvetleaf, Canada thistle, field bindweed and various triazine-resistant broadleaf weeds. Control is best when weeds are small and actively growing.

Uptake and Translocation: Readily absorbed by roots, stems or leaves and then translocated to other plant parts.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Preemergence or postemergence in field corn. For all other crops and non-crop uses, postemergence applications are recommended.

Residual Activity: Half-life in soil is approximately 30 days. Residue carryover into the next season is not a problem when applied at rates recommended for crop situations.

Unique Characteristics: Dicamba is often mixed with grass herbicides or with phenoxy herbicides to provide a broader spectrum of weed control. Spray drift is toxic to sensitive plants in the same manner as 2,4-D, thus similar precautions should be followed. Cold weather conditions and/or subsequent high rainfall after dicamba application may lead to temporary corn injury particularly on early-season hybrids in Eastern Ontario. There is also a possibility of dicamba vapour drift from treated plant foliage during high temperatures (in excess of 25°C). At higher rates, dicamba can be toxic to trees and shrubs having roots under the treated areas.

DICAMBA/ATRAZINE

Trade Name: MARKSMAN.

Chemical Family: Benzoic acid/s-triazine.

Crop and/or Non-Crop Registrations: Field corn.

Sensitive Weeds: Annual and biennial broadleaf weeds including the triazine-resistant biotypes.

Application Methods: Postemergence until the standing height of the corn is 13 cm (5-leaf stage).

Unique Characteristics: Marksman provides season long broadleaf weed control in corn. Marksman provides excellent control of triazine-resistant broadleaf weeds and is particularly effective in controlling velvetleaf and other later-germinating deep-rooted annuals.

DICAMBA/MCPA

Trade Name: DYVEL.

Chemical Family: Benzoic acid/phenoxy.

Crop and/or Non-Crop Registrations: Barley, spring wheat, winter wheat and oats.

Unique Characteristics: Provides better control of mustards and hemp-nettle than dicamba alone. Also see notes on DICAMBA and MCPA.

DICAMBA/MCPA/MECOPROP-P

Trade Name: TARGET, SWORD.

Chemical Family: Benzoic acid/phenoxy/phenoxy.

Crop and/or Non-Crop Registrations: Spring wheat, barley, oats not underseeded to legumes, stubble fields and summer fallow.

Sensitive Weeds: At field-crop rates: wild buckwheat, cow cockle, lady's-thumb, green smartweed, mustards, hemp-nettle, Russian thistle, corn spurry, flixweed, annual sow-thistle, shepherd's-purse, common ragweed, pigweeds, chickweed, lamb's-quarters, knotweed, volunteer rapeseed and sunflowers.

Application Methods: Postemergence when weed seedlings are in the 2- to 3-leaf stage, spring wheat and oats are in the 4- to 5-leaf stage and barley is in the 2- to 3-leaf stage. Use water carrier and apply at 100 L total spray mix/ha.

Unique Characteristics: This mixture controls a wider spectrum of weeds than any of the herbicide components used alone. Under certain conditions, this mixture may cause shortening of the straw of cereals but yield will not be affected. See also DICAMBA, MECOPROP-P and MCPA.

DICHLLOBENIL

Trade Name: CASORON.

Chemical Family: Benzonitrile.

Crop and/or Non-Crop Registrations: Cranberries, fruit trees, grapes, highbush blueberries, raspberries, container nursery stock, woody nursery stock, shelterbelts and non-crop areas.

Sensitive Weeds: Most weeds are susceptible to or suppressed by, dichlobenil including perennials, vetch and horsetail.

Uptake and Translocation: Absorbed by the roots and rapidly translocated upward in the plant.

Basis of Selectivity: Selectivity is based on physical separation between the dichlobenil vapour layer in the top 5 cm of soil and the established crop roots below this level.

Application Methods: Apply preemergence to the weeds, preferably in either fall or early spring.

Residual Activity: May persist and provide weed control for 2–6 months; higher rates and applications following use in previous year(s) may result in soil residues persisting for longer than 1 year.

Unique Characteristics: Although applied as a granular herbicide it kills by means of a vapour phase in the top soil profile. Weed roots take up the herbicide as they enter this zone. Do not apply dichlobenil during periods of high soil temperature, since loss of control will result due to volatilization of the herbicide.

DICHLORPROP/2,4-D

Trade Names: DIPHENOPROP BK 700, DESORMONE, ESTAPROP PLUS, DICHLORPROP D, TURBOPROP.

Chemical Family: Phenoxy/phenoxy.

Crop and/or Non-Crop Registrations: Spring and fall wheat and barley; perennial weed and brush control on non-cropland.

Unique Characteristics: Most properties of dichlorprop are very similar to those of 2,4-D. Chickweed, wild buckwheat, smartweed and some woody species are more sensitive to dichlorprop/2,4-D than to 2,4-D alone. Do not use on oats. See also 2,4-D.

DIFLUFENZOPYR/DICAMBA

Trade Name: DISTINCT.

Chemical Family: Semicarbazone/Benzoic acid.

Crop and/or Non-Crop Registrations: Field corn (silage and grain).

Sensitive Weeds: Redroot pigweed, common ragweed, lamb's-quarters, wild buckwheat, lady's-thumb and velvetleaf. Controls horsenettle and horsetail when tank-mixed with nicosulfuron/rimsulfuron. Control is best when weeds are actively growing.

Uptake and Translocation: Readily absorbed by roots, stems or leaves and then translocated to other plant parts.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Early postemergence to 6-leaf corn recommended.

Residual Activity: Half-life in soil is approximately 30 days. Residue carryover into the next season is not a problem when applied at registered rates.

Unique Characteristics: This product has a wider application window, a lower use rate and has better activity on perennial weeds than dicamba alone. Spray drift is toxic to sensitive plants in the same manner as 2,4-D, thus similar precautions should be followed. The auxin transport inhibitor, diflufenopyr, will also be active with other growth hormone herbicides such as 2,4-D and clopyralid and may cause crop injury if tank-mixed. Do not use additives such as oils, ionic surfactants, wetting agents, sticking agents, etc. Do not apply when there is a risk of severe drop in night temperature. Do not spray when temperatures are expected to exceed 27°C. Do not spray in high humidity or fog. Do not apply preemergence on sandy or sandy loam soils. Do not till or cultivate treated area for at least 7 days following application. Adding a non-ionic surfactant at 0.25% v/v plus liquid nitrogen fertilizer 28-0-0 at 1.25% is recommended under postemergence applications.

DIMETHENAMID

Trade Name: FRONTIER.

Chemical Family: Chloroacetamide.

Crop and/or Non-Crop Registrations: Corn (field, seed and sweet), dry beans (kidney, otebo and white, soybeans, dry bulb onions and non-bearing grape vines).

Sensitive Weeds: Green and yellow foxtail, barnyard grass, fall panicum, witch grass, large and smooth crab grass, redroot pigweed, eastern black nightshade, and tall waterhemp. Yellow nut sedge can be controlled with a preplant incorporated application.

Uptake and Translocation: Absorbed through shoots and roots of germinating grass and broadleaf weeds but primarily via plant coleoptile.

Basis of Selectivity: Not established.

Application Method: 1) preplant incorporated – incorporate with vibrating shank cultivator, harrow or other implement capable of giving uniform shallow incorporation into the top 5 cm of the soil within 7 days of planting; 2) preemergence – rainfall is needed within 10 days of application to achieve sufficient herbicide activation; 3) early postemergence (corn only) – apply at the spike to 3-leaf stage of corn and up to the 2-leaf stage of annual grass weeds.

Residual Activity: Provides season-long weed control. Length of residual activity depends upon soil and moisture factors, application rate and timing. Heavy rainfall following an incorporated treatment may reduce weed control.

Unique Characteristics: No recropping restrictions in the fall or spring application in corn or soybeans. Application flexibility; there are many tank-mix and sequential treatment options for broad-spectrum weed control in corn and soybeans in all tillage systems (zero tillage to conventional tillage). Mixes well with bulk liquid and dry fertilizers.

DIQUAT

Trade Name: REGLONE DESICCANT.

Chemical Family: Bipyridylum.

Crop and/or Non-Crop Registrations: Desiccation of canola (rapeseed), flax, dry beans, dry peas, mustard, sunflowers, soybeans, adzuki beans, legume seed crops. Vine killing of potatoes. Control of corn spurry in oats. Stale seedbed and inter-row weeding.

Sensitive Weeds: Any foliage contacted by diquat will be killed.

Uptake and Translocation: Rapidly absorbed by foliage. Limited translocation.

Basis of Selectivity: None.

Application Methods: Postemergence.

Residual Activity: Essentially none due to adsorption of chemical to soil particles.

Unique Characteristics: Must be used with clean (non-turbid) water as the soil particles in muddy water drastically reduce the effectiveness of diquat. Apply in weather conditions that will not promote drift. For aerial application suggested conditions for good application are moderate temperatures (less than 25°C), humidity (greater than 40%) and wind (3.6–10 kph). Do not apply in dead calm conditions or when temperature inversion is likely (e.g., morning or evening when warm air is rising from crop). To avoid spray drift, use flat fan or hollow cone nozzles and a pressure of 140–210 kPa. For aerial application point the nozzles back 130°–180°. For further information on aerial application see product label.

DIQUAT (AQUATIC)

Trade Name: REWARD.

Chemical Family: Bipyridylum.

Crop and/or Non-Crop Registrations: Aquatic weed control in still or flowing water in ponds, ditches, lakes and canals.

Sensitive Weeds: Coontail, Canada Waterweed, pond-weeds, milfoil and duckweed.

Uptake and Translocation: Contact desiccant with limited translocation.

Basis of Selectivity: None.

Application Methods: Postemergence. Apply when weeds are visible and are actively growing. It can be applied: with a boat bailer device that injects the chemical below the water surface; sprayed over the water surface; or poured directly from a container onto the surface.

Residual Activity: Quickly inactivated by adsorption to soil particles.

Unique Characteristics: Must be used with and applied on non-turbid water, as the soil particles in muddy water drastically reduce the effectiveness of the material. Do not use treated water for swimming or consumption by humans or animals for at least 24 hours. Do not use water for irrigation for 5 days after treatment. To avoid fish kills caused by oxygen depletion, treat only 1/4–1/3 of the area at a time. Avoid application or drift onto crops, lawns, grazing areas, ornamental plants and other desirable plants.

DITHIOPYR

Trade Name: DIMENSION.

Chemical Family: Pyridine.

Crop and/or Non-Crop Registrations: Turf.

Sensitive Weeds: Crab grass.

Uptake and Translocation: Absorbed through the shoots and roots. Limited translocation.

Basis of Selectivity: Differential uptake, translocation and metabolism in sensitive seedling weeds vs. established plants.

Application Methods: Preemergence or early postemergence up to the 3-leaf stage of crab grass.

Residual Activity: Effective weed control may be maintained for 3 months.

Unique Characteristics: Preemergence and early postemergence activity allows control of emerged plants and follow-up residual control of later germinating crab grass plants.

DIURON

Trade Name: KARMEX, DIUREX 80WDG.

Chemical Family: Substituted urea.

Crop and/or Non-Crop Registrations: Grapes, asparagus, gladioli, industrial sites, right-of-ways.

Sensitive Weeds: Annual and perennial grasses, pigweed, ragweed, wild carrot and dandelion. Perennial weed control at higher rates in non-crop areas.

Uptake and Translocation: Most readily absorbed by roots, less so by foliage. Translocated upward in the xylem.

Basis of Selectivity: Used only in deep-rooted crops that are well established.

Application Methods: Applied to crops as a preemergence or directed early postemergence spray, preferably before weed growth becomes dense. Better control of emerged weeds is obtained by the addition of a suitable surfactant. In non-crop areas, diuron may be sprayed anytime except when ground is frozen.

Residual Activity: At lower rates used in crops, residues last about a year and thus applications may be repeated annually. At higher non-crop rates, persistence may be more than 1 year.

Unique Characteristics: Do not use where it is likely to leach or wash into contact with the roots of desirable trees or shrubs.

ENDOTHALL

Trade name: HERBICIDE 273.

Chemical Family: Dicarboxylic acid.

Crop And/Or Non-Crop Registrations: Sugar beets.

Sensitive Weeds: Lady's-thumb, wild buckwheat, red-root pigweed, green foxtail and barnyard grass.

Uptake and Registration: Absorbed through the roots and shoots of actively growing weeds.

Basis of Selectivity: Not established.

Application Method: 1) preemergence broadcast spray onto seedbed during or just after planting. May also mix with sand and apply as a banded treatment. 2) postemergence – apply as a broadcast or banded treatment only after the weeds have emerged. For best results, the sugar beets should be in the 4- to 6-leaf stage and the average temperature should be above 15°C. Do not apply later than 40 days after emergence.

Residual Activity: Very short, up to 7 days.

Unique Characteristics: High moisture after application is essential for the best weed control. Works very slowly. Only tank-mix with betamix or betanex to expand weed control to include smartweed, knotweed, lamb's-quarters, ragweed, shepherd's-purse and nightshade.

EPTC

Trade Name: EPTAM.

Chemical Family: Thiocarbamate.

Crop and/or Non-Crop Registrations: Alfalfa, bird's-foot trefoil, flax, potatoes, sunflowers and annual flowers. EPTAM, are registered for use on a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations.

Sensitive Weeds: Annual grasses such as crab grass, barnyard grass, fall panicum, wild oats, green foxtail and yellow foxtail; yellow nut sedge; some annual broadleaf weeds such as corn spurry, lamb's-quarters, nightshade, pigweed and chickweed if conditions are favourable for germination and growth.

Uptake and Translocation: Uptake by underground plant parts (roots, hypocotyl and seed). Upward translocation to the growing tip.

Basis of Selectivity: Metabolized by tolerant species at the seed germination stage through enzymatic breakdown of the chemical. Seed food reserves also permit seedling to outgrow chemical effect.

Application Methods: Preplant incorporated or post-plant incorporated. May be applied using water or liquid fertilizers as the carrier. Dry fertilizers may also be used as a carrier when impregnated by licenced fertilizer dealers. To prevent chemical loss and reduced weed control, EPTC should be uniformly incorporated in the soil by setting the incorporation equipment (i.e., tandem disks, field cultivator with sweep teeth, or vibrating shank S-tine cultivator) to work the soil approximately 10 cm deep, followed by a levelling device. Irrigation (approximately 0.6 cm) can also be used to incorporate. When application and incorporation are done in separate operations, application should be a dry soil surface.

Residual Activity: Applied in the spring preplant, EPTC provides season-long weed control with no soil residues the following year to prevent crop rotation.

Unique Characteristics: EPTC does not need rainfall to activate and will not leach significantly under heavy rainfall. Under unfavourable germination conditions, leaf crinkling or leaf sealing may be observed on certain crops but usually without adverse effects on yield. May be tank-mixed with metribuzin for additional broadleaf weed control in potatoes. May be tank-mixed with ethalfuralin or trifluralin for additional broadleaf weed control in beans (white, snap and kidney). See label for other tank-mix combinations and information on less conventional application methods.

EPTC/R29148 (EPTC+)

Trade Name: ERADICANE.

Chemical Family: Thiocarbamate.

Crop and/or Non-Crop Registrations: Corn (ensilage, field and sweet).

Sensitive Weeds: Annual grasses such as wild oats, crab grass, barnyard grass, foxtails, fall panicum; suppression of wild proso millet; yellow nut sedge, horsetail and some annual broadleaf weeds when conditions are favourable for germination and growth.

Uptake and Translocation: Uptake by underground plant parts (roots, hypocotyl and seed) then upward translocation to the growing tip.

Basis of Selectivity: Metabolized by tolerant species at the seed germination stage through breakdown of the chemical. R29148 enhances the enzymatic breakdown of the chemical in tolerant species. Also, seed food reserves permit corn seedlings to outgrow chemical effect.

Application Methods: EPTC/R29148 may be applied using water or liquid fertilizers as the carrier. Dry fertilizers may also be used as a carrier when impregnated by licenced fertilizer dealers. To prevent chemical loss and reduced weed control, incorporate EPTC/R29148 uniformly into the soil by setting the incorporation equipment (i.e., tandem disks, field cultivator with sweep teeth or vibrating shank S-tine cultivator) to work the soil approximately 10 cm deep, followed by a levelling device. Irrigation (approximately 0.6 cm) can also be used to incorporate. When application and incorporation are done in separate operations, apply to a dry soil surface and incorporate within 4 hours of application. Pre-plant incorporated EPTC+ may be used in tank-mix combination with 1) atrazine for additional broadleaf weed control or 2) metolachlor using reduced rates of both herbicides for more consistent control of many annual grasses.

Residual Activity: Provides season-long weed control with no soil residues the following year to prevent crop rotation. In tank mix combinations with atrazine, there may be atrazine residues when the highest atrazine rate is used.

Unique Characteristics: EPTC/R29148 does not need rainfall to be activated and will not leach significantly under heavy rainfall.

ETHAMETSULFURON-METHYL

Trade Name: MUSTER.

Chemical Family: Sulfonfyl urea.

Crop and/or Non-Crop Registrations: Spring Canola.

Sensitive Weeds: Wild mustard.

Uptake and Translocation: Following foliar application, is rapidly absorbed and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert etha-metsulfuron-methyl to non-phytotoxic metabolites.

Application Methods: Postemergence.

Residual Activity: Rapid soil microbial degradation.

Unique Characteristics: A non-ionic surfactant must be added. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on growing conditions.

ETHOFUMESATE

Trade Name: NORTRON.

Crop and/or Non-Crop Registrations: Sugar beets.

Sensitive Weeds: Chickweed, lamb's-quarters, kochia, redroot pigweed, Russian thistle, wild buckwheat, barnyard grass, large crab grass, foxtails and downy brome.

Uptake and Translocation: Readily absorbed by emerging shoots (grass coleoptile and broadleaf hypocotyl) and roots, and translocated readily to the foliage. Postemergence applications of ethofumesate are poorly absorbed by maturing leaves with a well-developed cuticle.

Basis of Selectivity: Tolerant species conjugate the herbicide, rendering it inactive.

Application Methods: Preplant incorporated, preemergence.

Residual Activity: Half-life of less than 5 to more than 14 weeks depending on soil temperature and moisture conditions. Half-life increases in cooler, drier soils.

FENOXAPROP-P-ETHYL

Trade Name: EXCEL SUPER, ACCLAIM SUPER.

Chemical Family: Aryloxyphenoxypropionate.

Crop and/or Non-Crop Registrations: EXCEL SUPER – Asparagus, broccoli, cabbage, cauliflower, carrots, peas (field and processing), potatoes, canola (rape-seed), triazine-tolerant canola, soybeans, tomatoes. EXCEL SUPER is registered for use on a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations. ACCLAIM SUPER – Lawns and turf.

Sensitive Weeds: Barnyard grass, green and yellow foxtail, crab grass, witch grass, wild proso millet, fall panicum, volunteer corn.

Uptake and Translocation: Uptake primarily through the leaves. Does not translocate significantly.

Basis of Selectivity: Differential metabolism by tolerant vs. sensitive species.

Application Methods: Non-residual postemergence for the control of annual grasses (EXCEL SUPER: 1- to 6-leaf stage; ACCLAIM SUPER: 1- to 4-leaf stage plus 3 tillers). For best results, apply when weeds are young and actively growing. EXCEL SUPER – Do not apply if rainfall is expected within 1 hour of application. ACCLAIM SUPER – Do not apply if rainfall is expected within 3 hours of application.

Residual Activity: Essentially none.

Unique Characteristics: EXCEL can be tank-mixed with BASAGRAN FORTÉ and/or PINNACLE for broad-spectrum annual weed control in soybeans and dry beans only. If annual grasses are in the correct stage for application before broadleaf weeds have emerged, do not delay EXCEL SUPER application.

FENOXAPROP-P-ETHYL/SAFENER

Trade Name: PUMA¹²⁰ SUPER.

Chemical Family: Aryloxyphenoxypropionate.

Crop and/or Non-Crop Registrations: Spring Wheat.

Sensitive Weeds: Control of wild oats.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence, apply to wild oats at the 1- to 6-leaf stage (plus 3 tillers) and prior to

flag leaf emergence of spring wheat. For best results, apply when weeds are young and actively growing.

Residual Activity: Essentially none.

Unique Characteristics: PUMA¹²⁰ SUPER can be tank-mixed with BUCTRIL M for broad-spectrum annual broadleaf weed control in spring wheat. Treatment at the 3–4 leaf stage of crops and weeds usually combines maximum crop tolerance and weed susceptibility. Under stressed conditions and/or heavy crop canopy, earlier application will result in improved grassy weed control. PUMA¹²⁰ SUPER contains a safener which allows spring wheat to metabolize fenoxaprop-p-ethyl. Spraying spring wheat with a fenoxaprop-p-ethyl product not containing this safener (i.e. EXCEL SUPER) will severely injure spring wheat.

FLUAZIFOP-P-BUTYL

Trade Names: VENTURE L.

Chemical Family: Aryloxyphenoxypropionate.

Crop and/or Non-Crop Registrations: Flax, canola, soybeans, sugar beets, sunflowers, tobacco, forage legumes (alfalfa, red clover and bird's-foot trefoil), cabbage, broccoli, Brussels sprouts, cauliflower, cucumber, onions, potatoes, rutabagas, tomatoes, lowbush and highbush blueberries, raspberries, strawberries, non-grassy ornamental plants, poplars, shrubs, trees, apples, apricots, cherries, cranberries, peaches, pears and plums, forest and ornamental nurseries.

Sensitive Weeds: Annual grass species, volunteer corn, wheat, barley and quack grass.

Uptake and Translocation: Absorbed primarily by leaves. Translocated to roots and rhizomes.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence. Apply when grasses are actively growing, and annual grasses are in the 2- to 5-leaf stage and quack grass is in the 3- to 5-leaf stage.

Residual Activity: Essentially none.

Unique Characteristics: Preplant tillage to break up rhizomes will improve control of quack grass. Except as noted on the label, apply broadleaf herbi-

cides separately at least 3 days after fluzifop-p-butyl. Do not cultivate for 5 days after applying fluzifop-p-butyl. When plants are stressed (lack of moisture, excessive humidity, low temperature and/or very low relative humidity), fluzifop-p-butyl is less effective. Regrowth by tillering may occur if application is made under any of the above conditions. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

FLUFENACET

Trade Name: DEFINE DF.

Chemical Family: Oxyacetamide.

Crop and/or Non-Crop Registrations: Corn (Field).

Sensitive Weeds: Green foxtail, suppression of lamb's-quarter and redroot pigweed.

Uptake and Translocation: Flufenacet is absorbed through shoots (primarily coleoptile) and roots of germinating grasses and broadleaf weeds. Basis of Selectivity: Metabolized by tolerant species.

Application Method: Postemergence from the spike to 3 leaf stage of corn.

Residual Activity: Residual soil activity by flufenacet will normally be maintained for approximately 21 days after application.

Unique Characteristics: DEFINE DF is sold only in a co-pack with OPTION 2.25 called OPTION 1.2.3. Do not use on muck soils or coarse textured soils with low organic matter.

FLUMETSULAM/S-METOLACHLOR

Trade Name: BROADSTRIKE DUAL MAGNUM.

Chemical Family: Triazolopyrimidine sulfonanilide/acetanilide.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Common lamb's-quarters, redroot pigweed, Eastern black nightshade, American nightshade, common ragweed, velvetleaf, cocklebur, barnyard grass, crab grass (smooth, hairy), foxtail (green, yellow, giant), fall panicum, witch grass, yellow nut sedge.

Uptake and Translocation: Flumetsulam and s-metolachlor are absorbed by both roots and shoots of ger-

minating broadleaf weeds. S-metolachlor is absorbed by germinating grasses mainly through the shoot just above the seed.

Basis of Selectivity: Selectivity of flumetsulam in soybeans is based on metabolism. Basis of selectivity of metolachlor not established.

Application Methods: Surface preplant, preplant incorporated or preemergence.

Residual Activity: The most significant means of dissipation of both s-metolachlor and flumetsulam is microbial degradation. Provides season-long residual control of annual broadleaf and grass weeds. Rotational crops are winter wheat, spring wheat, spring barley, soybeans, common beans (dry, snap), lima beans, peas, field corn, seed corn.

Unique Characteristics: Can be applied up to 21 days before planting. Rainfall within 7–10 days is required for maximum activity of a preemergence application. Do not apply to areas where the soil pH is more than 7.8 and organic matter is less than 2%. Do not apply to soils containing more than 5% organic matter. Suspension concentrate formulation separates into 2 phases over time. Shake container well before using.

FOMESAFEN

Trade Name: REFLEX.

Chemical Family: Diphenyl ether.

Crop Registrations: Soybeans, and is registered for use on a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations.

Sensitive Weeds: Redroot pigweed, common ragweed, wild mustard, lady's-thumb, black nightshade, cocklebur; suppression of velvetleaf, lamb's-quarters, tall waterhemp.

Uptake and Translocation: Taken up through foliage. Not readily translocated.

Mode of Action: Cell-membrane disrupter.

Method of Selectivity: Beans metabolize fomesafen. Some initial bronzing of crop leaves may occur, but plants normally outgrow this condition without any effect on maturity or yield.

Application Method: Early postemergence to weeds and crop. Apply when beans are 1–2 trifoliate and weeds are at the 2- to 4-leaf stage. Good coverage is essential for optimum weed control. Apply in 200–350 L of water/ha at a pressure between 245–420 kPa. Always add an adjuvant such as AGRAL 90 (0.25% v/v) or TURBOCHARGE (0.5% v/v). PINNACLE or VENTURE may be tank-mixed for additional weed control.

Residual Activity: Persistence depends on weather and soil conditions (more persistent under dry conditions). Rotation to field corn, dry beans or soybeans the following year. Winter wheat may be planted 90 days after treatment. All other crops require a field bioassay.

Unique Characteristics: Do not apply REFLEX to any field more than once every 2 years.

FORAMSULFURON

Trade Name: OPTION 2.25 OD.

Chemical Family: Sulfonylurea.

Crop and/or Non-Crop Registrations: Field Corn.

Sensitive Weeds: Quackgrass, green, yellow and bristly foxtail, fall panicum, proso millet, barnyard grass, old witchgrass, large crabgrass, redroot pigweed, common lamb's-quarters, velvetleaf, Eastern black nightshade, common chickweed, wild and wormseed mustard.

Uptake and Translocation: Foramsulfuron is quickly absorbed through leaves and rapidly translocated throughout the plant.

Basis of Selectivity: Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants. Tolerant species rapidly metabolize foramsulfuron.

Application Methods: Postemergent from the 1- to 8-leaf stage of corn, emerged grassy weeds up to the early tillering stage, emerged broadleaf weeds.

Residual Activity: Essentially none.

Unique Characteristics: Addition of the safener isoxadifen in the formulated product maximizes crop tolerance, enhances crop recovery under severe environmental conditions and allows the use of an ethylated/methylated seed oil based adjuvant system.

Methylated seed oil (Hasten) should only be used with OPTION 35 DF, as OPTION 2.25 OD does not require the addition of Hasten. OPTION 35 DF is applied at a rate of 100 g/ha or 40 g/ac plus 1.75 L/ha or 0.7 L/ac Hasten.

FORAMSULFURON + FLUFENACET

Trade Name: OPTION 1.2.3. (co-pack of OPTION 2.25OD + DEFINE DF. This co-pack MUST BE tank-mixed with atrazine).

Chemical Family: Sulfonylurea + oxyacetamide.

Crop and/or Non-Crop Registrations: Corn (Field).

Sensitive Weeds: Annual broadleaf weeds including lamb's-quarters, redroot pigweed, common ragweed, velvetleaf, wild buckwheat, lady's-thumb, wild mustard, annual sowthistle, eastern black nightshade, green foxtail, yellow foxtail, witchgrass, barnyard grass and fall panicum. Suppression of annual grass weeds including large crabgrass and proso millet.

Uptake and Translocation: Refer to notes on foramsulfuron, flufenacet and atrazine.

Basis of Selectivity: Metabolized by tolerant species.

Application Methods: Postemergence to corn (up to and including 3-leaf stage), when weeds are small and actively growing. Apply in a minimum volume of 150 L/ha with a pressure of 175–275 kPa.

Residual Activity: Residual soil activity by flufenacet will normally be maintained for approximately 21 days after application.

Unique Characteristics: OPTION 1.2.3. is sold as a co-pack of Option 2.25OD and Define DF Herbicide. The atrazine component is sold separately but is a necessary component of the tankmix. UAN (28%) should be added to the tank at a rate of 1L/ac (2.5 L/ha). OPTION 1.2.3. provides excellent season-long control of Fall Panicum

FOSAMINE AMMONIUM

Trade Name: KRENITE.

Chemical Family: Carbamoyl phosphonate.

Crop and/or Non-Crop Registrations: Vine and brush control on non-cropland.

Sensitive Weeds: Control and growth suppression of blackberry, oak, pine, sumac, maple, elder, elm, wild rose, hazel, aspen and beech. Cedar and spruce are quite tolerant.

Uptake and Translocation: Absorption by young stems and foliage. Translocation has been observed from a treated mature leaf to all other parts of a plant but phloem transport with sugars is predominant.

Basis of Selectivity: Not highly selective.

Application Methods: Postemergence. Apply with high pressure ground equipment to ensure penetration of spray to thoroughly wet leaves, buds, stems and trunks of target brush. Surfactants are recommended to promote rapid leaf penetration.

Residual Activity: Essentially none.

Unique Characteristics: Woody plants treated with fosamine ammonium die very slowly; the stems may not be completely killed 2 years after treatment; the unsightly brown-out effect common to many other herbicides does not occur. Rainfall within 24 hours of application may decrease effectiveness.

FUMIGANTS

See METAM SODIUM, METHYL-BROMIDE/
CHLOROPICRIN

GLUFOSINATE AMMONIUM

Trade Name: IGNITE, LIBERTY 200SN.

Chemical Family: Unique.

Crop and/or Non-Crop Registrations: IGNITE – Desiccation of dry beans and potatoes; directed applications in apples, grapes, peaches, pears and plums; stale seedbed techniques in asparagus, carrots, lettuce and onions; ground crack application in potatoes. LIBERTY 200SN – Corn hybrids and canola varieties specially developed to be tolerant to Liberty 200SN herbicide. Glufosinate-ammonium tolerant inbred lines grown for seed corn production.

Sensitive Weeds: Non-selective – affects all actively growing green plants; regrowth of perennial species may occur.

Uptake and Translocation: Absorbed through foliage; minimal translocation – dependent on application rate and species treated.

Basis of Selectivity: IGNITE – All green plant tissue is sensitive; safe on mature (non-green) bark of woody plants. LIBERTY 200SN – All green plant tissue is sensitive except for field corn, seed corn and canola plants that have been specially developed to be tolerant.

Application Methods: IGNITE – Postemergence; broadcast or directed spray to avoid contact with leaves or green bark of desirable plants; thorough coverage of the plant tissue to be controlled is essential. LIBERTY 200SN – Postemergence. Can be broadcast in corn at the 1- to 8-leaf stage, apply with drop nozzles to later corn growth stages; cotyledon to early bolting stage in canola.

Residual Activity: None; there are no cropping or rotational restrictions after application.

Unique Characteristics: Speed of action is influenced by environmental factors; at cool temperatures, poor moisture and low humidity, speed of action may be reduced. Heavy dew at time of application may reduce control of certain weed species.

GLYPHOSATE DIAMMONIUM

Trade Name: TOUCHDOWN iQ. See
GLYPHOSATE.

GLYPHOSATE

Trade Names: CATENA HERBICIDE, CREDIT, CREDIT PLUS, CLEAR-IT 1, CLEAR-IT 2, CLEAR-IT 3, E-Z-JECT, FACTOR, FACTOR 540 GLYPHOSATE, FORZA SILVICULTURAL HERBICIDE, GLYFOS, RENEGADE, ROUNDUP ULTRA 2, ROUNDUP WEATHERMAX, VANTAGE, VANTAGE FORESTRY HERBICIDE, SHARPSHOOTER, SHARPSHOOTER PLUS, TOUCHDOWN iQ, TOUCHDOWN TOTAL, VANTAGE PLUS, VANTAGE PLUS MAX, VISION, VISION MAX.

Chemical Family: Amino acid.

Crop and/or Non-Crop Registrations: Preplant or postharvest with no cropping restrictions. Preharvest in wheat, barley, soybeans, canola, flax, lentils, peas and forages. Roundup Ready Crops – refer to Table 4-2, page 59. Directed applications in ginseng, cherries, grapes, apples, pears, plums and peaches, strawberries as wiper or spot treatment. Non-crop registrations: Brush control; turf renovation; chemical mowing; directed application in woody nursery stock, roadsides and shelterbelts. E-Z-JECT – Selective woody brush and tree control. CATENA HERBICIDE, FORZA SILVICULTURAL HERBICIDE, VANTAGE FORESTRY HERBICIDE, VISION, VISION MAX – Silvicultural site preparation, conifer release, forest tree plantings, forest tree nurseries.

Sensitive Weeds: Annual grasses; perennial weeds (quack grass, Canada thistle, sow-thistle, field bindweed, milkweed, catrails, nut sedge, poison-ivy etc.); brush (birch, alder, poplar, raspberry, willow and maple).

Uptake and Translocation: Absorbed through foliage and translocated throughout the plant.

Basis of Selectivity: Non-selective for agricultural crops. Conifers are tolerant at some stages but the basis has not been established.

Application Methods: Postemergence, usually at the bud to bloom stage of growth for most perennial weeds. Canada thistle should be at least in early flower bud, milkweed at flower bud and bindweed at full flower. Quack grass can be treated in the spring or fall when it is actively growing with at least 3–4 new leaves on each emerged shoot; in the fall, remove crop refuse but do not till prior to application; fall or spring tillage prior to spring application may reduce control; wait at least 3–5 days after application before working the area; for maximum control it is advisable to till before the quack grass turns completely brown. Glyphosate can be applied with boom equipment, knapsack sprayers and high-volume equipment for agricultural and non-crop uses. Backpack mist blowers may be used for silvicultural site preparation and roadside brush control

only. Aerial applications may be used for silvicultural site preparation and conifer release only. Can also be applied with selective equipment for non-crop areas, tree plantings, grapes and orchards (See *Special Methods of Weed Control*, page 78 and *Wick Wiper and Roller Application*, page 83). Regardless of method of application, do not allow herbicide solution to contact green foliage or green bark of crop or other desirable plants; remove all suckers from the trunks of desirable trees before spraying.

Residual Activity: None – crops can be planted or seeded directly into treated areas following application. Other herbicides are required to control weeds emerging after the application.

Unique Characteristics: Rainfall within 6 hours after application or heavy frost within 24 hours may reduce control for 356 g/L formulations. 360 g/L formulations are rainfast as soon as 4 hours after application. ROUNDUP ULTRA, ROUNDUP WEATHERMAX and TOUCHDOWN TOTAL are rainfast as soon as 1 hour after application.

HEXAZINONE

Trade Names: PRONONE, VELPAR.

Chemical Family: Triazine.

Crop and/or Non-Crop Registrations: Christmas trees, coniferous reforestation, non-cropland.

Sensitive Weeds: Most herbaceous broadleaf weeds and grasses including raspberry, bluejoint grass, golden-rod and brome grass; spot applications control aspen, ash, maple, cherry and birch.

Uptake and Translocation: Absorbed through roots and foliage; translocation is primarily upwards through xylem.

Basis of Selectivity: Tolerant species metabolize hexazinone faster than sensitive species. For conifers, at least part of the selectivity is due to the tree roots being deeper than hexazinone leaches into the soil.

Application Methods: For broadcast applications, apply preemergence or as a postemergence foliar spray during active plant growth. For spot applications, use an exact-delivery hand gun applicator to apply undiluted VELPAR-L as close as possible to the root

collar of plants to be controlled; keep spots at least 1 m away from desirable conifers. Apply PRONONE with an approved granular applicator.

Residual Activity: Half-life of 2 months on a Flanagan silt loam in Illinois. Half-life of 2½ months on a silty clay in Northern Ontario.

Unique Characteristics: Rainfall is needed to activate hexazinone in the soil. Do not use on sandy, gravelly or rocky soils, or on frozen ground. Do not apply on steep slopes. Do not apply to areas where the roots of desirable trees may extend. Liquid formulation is flammable. A bioassay may be used to determine soil residue levels when sensitive crops are to be planted in soil treated with hexazinone.

IMAZAMOX

Trade Name: VIPER (Available only in VIPER co-pack), MERIDIAN (Available only in MERIDIAN PLUS co-pack).

IMAZAMOX + BENTAZON

Trade Name: MERIDIAN PLUS (co-pack of MERIDIAN + BASAGRAN FORTÉ).

Chemical Family: Imidazolinone + Benzothiadiazine.

Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass (barnyard grass, green and yellow foxtail, fall panicum) and broadleaf (cocklebur, lamb's-quarters, pigweed, ragweed, velvetleaf, lady's-thumb, wild mustard, eastern black nightshade) species including triazine resistant biotypes.

Uptake and Translocation: Contact and systemic. Absorption occurs through foliage and roots.

Basis of Selectivity: Metabolism by soybeans.

Application Methods: Postemergence, weeds should be actively growing and be between the second and sixth leaf stage. A liquid ammonium fertilizer solution (such as UAN) must be added at 2 L/ha.

Unique Characteristics: Some rotational restrictions apply. (See label for details).

IMAZAMOX + FOMESAFEN

Trade Name: VIPER (co-pack of VIPER + REFLEX).

Chemical Family: Imidazolinone + diphenyl ether.

Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass (barnyard grass, green and yellow foxtail, witch grass) and broadleaf (cocklebur, lamb's-quarters, pigweed, ragweed, velvetleaf, lady's-thumb, mustards, nightshades) species including triazine resistant biotypes.

Uptake and Translocation: Contact and systemic. Absorption occurs through foliage and roots.

Basis of Selectivity: Metabolism by soybeans.

Application Methods: VIPER is a postemergent program. Apply to actively growing weeds in the cotyledon to 6 true-leaf stage once soybeans have reached the first trifoliate stage. Adding a non-ionic surfactant and liquid fertilizer solution are required. VIPER also provides control of some late-emerging weeds.

Residual Activity: Rotational crops include field corn, soybeans, winter wheat.

Unique Characteristics: Some rotational restrictions apply. (See label for details).

IMAZAPYR

Trade Name: ARSENAL.

Chemical Family: Imidazolinone.

Crop and/or Non-Crop Registrations: Non-crop/non-graze areas such as industrial sites, railroad ballast, spot treatments for rail and highway rights-of-way and pipeline rights-of-way stations including well sites, battery stations and compressor or valve stations.

Sensitive Weeds: Annual and perennial grass and broadleaf weeds such as: annual – black medick, rough cinquefoil, common groundsel, hemp-nettle, kochia, lamb's-quarters, mustard spp., pigweed spp., pineappleweed, ragweed spp., Russian thistle, stinkweed, annual sow-thistle, wild buckwheat, annual bluegrass, foxtail spp., witch grass; biennial/perennial – bladder campion, bull thistle, burdock, Canada thistle, sulfur cinquefoil, clover spp., dandelion, dog-strangling vine, field bindweed, goat's beard, golden-

rod, leafy spurge, milkweed, mouse-eared chickweed, mullein spp., ox-eye daisy, plantain spp., poison-ivy, sheep sorrel, toadflax, tufted vetch, wild carrot, wild grape, wild strawberry, brome grass, Canada bluegrass, fescue spp., quack grass, yellow nut sedge; Seedling woody species – maple, poplar, raspberry and wild rose.

Uptake and Translocation: Absorbed by both roots and foliage of sensitive vegetation. Translocated in both the xylem and phloem.

Basis of Selectivity: None.

Application Methods: Postemergence on actively growing weeds. Control of non-emerged sensitive species will also be provided in the year of application. Apply in 100–550 L of water/ha with high-volume, high-pressure handguns and vehicle-mounted directed-spray equipment or conventional boom-mounted, manifold-mounted or off-centred nozzles. Low-volume, hand-held backpacks, knapsacks or other pump-up-type sprayers may also be used for direct applications to foliage. Addition of non-ionic surfactant at 1 L/400 L of spray solution is recommended for spray volumes greater than 550 L/ha. A foam-reducing agent may be added at the recommended rate, if required.

Residual Activity: Season-long control of sensitive species.

Unique Characteristics: Do not contaminate ponds, lakes, streams, wetlands or sloughs and do not apply within 15 m of a wetland area or body of water. Do not mix or store in unlined steel (except stainless steel) containers or spray tanks. For ground application only. Do not use where roots from desirable vegetation may extend into the treated area (maintain a distance from desirable trees equal to at least twice the distance from the trunk to the dripline). To be used by licensed applicators only.

IMAZETHAPYR

Trade Name: CONQUEST B (Available only in CONQUEST co-pack), PURSUIT.

Chemical Family: Imidazolinone.

Crop and/or Non-Crop Registrations: Soybeans, a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations, Clearfield corn, Clearfield Canola processing peas, snow peas and alfalfa for seed production.

Sensitive Weeds: Soil applications – green foxtail, yellow foxtail, witch grass, barnyard grass, lamb's-quarters, redroot pigweed, smartweed, lady's-thumb, wild mustard, velvetleaf, common ragweed and reduced competition from eastern black nightshade and proso millet. Postemergence application – green foxtail, yellow foxtail, witch grass, barnyard grass, redroot pigweed, velvetleaf, wild mustard, cocklebur, eastern black nightshade, ragweed and reduced competition from proso millet, large crab grass, lamb's-quarter's, wild buckwheat and yellow nut sedge. Late postemergence application – green and yellow foxtail (up to 4-leaf stage), barnyard grass (up to 6-leaf stage), redroot pigweed (up to 12-leaf stage) and velvetleaf (up to 8-leaf stage).

Uptake and Translocation: Absorbed by both roots and foliage. Translocation in both xylem and phloem.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Early preplant (up to 30 days before planting), preplant incorporated, preemergence and postemergence up to the 2-leaf stage of weeds.

Residual Activity: Persistence depends on weather and soil conditions (more persistent under dry conditions). Some rotational restrictions apply, refer to Tables 4-3, page 60 and 4-4, page 62 for more information.

Unique Characteristics: Can be applied up to 30 days prior to planting. Registered for use in reduced and no-till situations. Tank-mixing is recommended for heavy infestations of ragweed or barnyard grass. Postemergence application requires the addition of AGRAL 90, AGSURF or ENHANCE surfactant and liquid fertilizer solution. Temporary soybean

discoloration and/or shortening may occur with postemergence applications. A period of 100 days is required between application and planting winter wheat.

IMAZETHAPYR + BENTAZON

Trade Name: CLEANSWEEP (co-pack of PURSUIT + BASAGRAN FORTÉ).

Chemical Family: Imidazolinone + Benzothiadiazine.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass (barnyard grass, green and yellow foxtail) and broadleaf (cocklebur, flower-of-an-hour, lady's-thumb, lamb's-quarters, pigweed, ragweed, shepherd's-purse, stinkweed, velvetleaf, wild mustard, eastern black nightshade) species including triazine resistant biotypes and reduced competition from yellow nut sedge, Canada thistle and field bindweed.

Uptake and Translocation: Contact and systemic. Absorption occurs through foliage and roots.

Basis of Selectivity: Metabolism by soybeans.

Application Methods: Postemergence.

Unique Characteristics: A liquid ammonium fertilizer solution (such as UAN) must be added at 21 L/ha. Some rotational restrictions apply. See label for details. Refer to notes on IMAZETHAPYR and BENTAZON for additional information on each component.

IMAZETHAPYR + METRIBUZIN

Trade Name: CONQUEST (co-pack of CONQUEST A + CONQUEST B).

Chemical Family: Imidazolinone + s-triazine.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled.

Application Methods: Early preplant incorporated and preemergence.

Unique Characteristics: Some rotational restrictions apply. See label for details. Refer to notes on imazethapyr and metribuzin for additional information on each component.

IMAZETHAPYR/PENDIMETHALIN

Trade Name: VALOR.

Chemical Family: Imidazolinone/dinitroaniline.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass and broadleaf species including triazine-resistant biotypes. See label for specific species controlled.

Application Methods: Preplant incorporated.

Unique Characteristics: Some rotational restrictions apply. See label for details. Refer to notes on imazethapyr and pendimethalin for additional information on each component.

ISOXAFLUTOLE + ATRAZINE

Trade Name: CONVERGE (co-pack CONVERGE PRO + CONVERGE 480).

Chemical Family: Isoxazole+s-triazine.

Crop and/or Non-Crop Registrations: Corn, field.

Sensitive Weeds: Annual grasses and broadleaf weeds including triazine and ALS inhibitor tolerant biotypes: green, yellow and giant foxtail, barnyard grass, witch grass, large and smooth crabgrass, lamb's-quarters, pigweed, common ragweed, eastern black nightshade, velvetleaf, wild mustard, wormseed mustard, wild buckwheat, lady's-thumb, seedling dandelion and seedling plantain.

Uptake and Translocation: Absorbed by roots and shoots of germinating weeds.

Basis of Selectivity: Metabolized by tolerant species. Preemergence. Provides season long weed control. Winter wheat can be grown 4 months after application, corn, soybeans, spring cereals, alfalfa, spring canola and processing peas can be grown the following year. Weed seedlings that emerge prior to activation of herbicide by rainfall can be controlled if less than 5 cm in height. For use on sandy loam or finer textured soils with a minimum of 2% organic matter.

ISOXABEN

Trade Name: GALLERY.

Chemical Family: Benzamide.

Crop and/or Non-Crop Registrations: Bareroot and container conifer seedlings.

Sensitive Weeds: St. John's-wort, pineappleweed, lamb's-quarters, purslane, shepherd's-purse, low cudweed and purslane speedwell.

Uptake and Translocation: Absorbed by roots and translocated to the shoots of germinating weeds.

Basis of Selectivity: Root selectivity.

Application Methods: Applied prior to weed emergence in conifers, 4 or more weeks after crop germination and emergence. Rainfall or irrigation is needed to activate the herbicide.

Residual Activity: Provides season-long control. Germination of some sensitive crop species may be reduced in the year following treatment.

Unique Characteristics: Gallery is registered for use only by members of the Canadian Forest Nursery Weed Management Association.

LINURON

Trade Name: LOROX L.

Chemical Family: Substituted urea.

Crop and/or Non-Crop Registrations: Corn, soybeans, carrots, celery, dill, parsnips, potatoes, asparagus, wheat, oats, barley, gladioli, fruit trees.

Sensitive Weeds: Annual weeds such as barnyard grass, common chickweed, corn spurry, crab grass, velvetleaf, fall panicum, foxtail, goosefoot, goose grass, groundsel, knotweed, lamb's-quarters, redroot pigweed, purslane, common ragweed, shepherd's-purse, smartweed, stinkweed, wild buckwheat, witch grass, wormseed mustard, triazine-resistant weeds; seedlings only of dandelion, plantain and sow-thistle.

Uptake and Translocation: Readily absorbed through roots, less so through foliage; translocation primarily upwards in xylem.

Basis of Selectivity: Differential metabolism often coupled with differential uptake and translocation.

Application Methods: Preemergence, postemergence, directed postemergence, pre plus postemergence.

Residual Activity: Does not pose a problem for subsequent crops since phytotoxic residues from applications at agricultural rates disappear within 4 months.

Unique Characteristics: Do not use on sandy or coarse-textured soils having less than 2% organic matter. If unusually heavy rains follow application, severe injury may occur to corn, soybeans, carrots and potatoes.

MALEIC HYDRAZIDE

Trade Name: ROYAL MH 60 SG.

Chemical Family: Unique.

Crop and/or Non-Crop Registrations: Growth control in lawns, turf, trees and shrubs. Sprout control in stored onions and potatoes.

Sensitive Weeds: Controls the growth of wild onion, garlic and biennial-type weeds such as dandelion and plantain when applied in the fall.

Uptake and Translocation: Absorbed through foliage. Translocated to active growing points in plant. Translocated more effectively downwards.

Basis of Selectivity: Not established.

Application Methods: Postemergence. Use as a foliar spray. Dosage and stage of plant development are critical factors. To reduce or eliminate mowing, apply in the spring or fall to green non-dormant grass; can be mixed with 2,4-D for spring applications. For tree and shrub growth control, apply to the portion of the plant on which growth is to be inhibited; growth control is best when applied to vigorous new growth; spray leaves and bark to point of run-off.

Residual Activity: None.

Unique Characteristics: Do not apply on or near crops being grown for seed. Rain within 24 hours after application will reduce effectiveness. Since temporary discoloration of grass may result, this chemical is recommended for use in areas where mowing grass is difficult and where lawn-like appearance is not necessary.

MCPA

Trade Names: CHECKMATE MCPA ESTER 600, IPCO MCPA ESTER 600, MCPA-SODIUM SALT, MCPA AMINE, MCPA ESTER, NUFARM MCPA ESTER 600.

Chemical Family: Phenoxy.

Crop and/or Non-Crop Registrations: Cereal crops, turf, non-crop sites.

Sensitive Weeds: Many broadleaf weeds, especially buttercup, hemp-nettle, field horsetail (top growth only), seedling dock.

Uptake and Translocation: Absorbed through leaves or roots. Translocates to, and accumulates at, growing points of shoots and roots.

Basis of Selectivity: Differences in interception, penetration, translocation, metabolism and sensitivity of active sites leads to greater activity in broadleaf weeds than grasses.

Application Methods: Postemergence.

Residual Activity: Some soil residues can be detected for up to 1 month under moist conditions and 2 months under drier conditions.

Unique Characteristics: MCPA is available in amine ester or sodium salt formulations. It is safer than 2,4-D for use on oats, flax and peas. As with 2,4-D, there is a potential drift hazard to nearby susceptible crops such as grapes, turnips, tobacco and cabbage.

MCPB/MCPA

Trade Name: CLOVITOX PLUS, TOPSIDE, TROPOTOX PLUS.

Chemical Family: Phenoxy/phenoxy.

Crop and/or Non-Crop Registrations: Seedling white, ladino, alsike or red clovers direct seeded or underseeded in wheat, oats, barley, rye, pastures, field corn, peas, grapes (not TOPSIDE).

Sensitive Weeds: Small emerged mustards, stinkweed, ragweed, lamb's-quarters, redroot pigweed, shepherd's-purse, volunteer rapeseed, wild radish, hemp-nettle, annual sow-thistle; top-growth control of bull thistle, Canada thistle, curled dock, plantain, perennial sow-thistle, field bindweed, horsetail, buttercup.

Uptake and Translocation: Absorbed through the foliage and readily translocated, especially to the growing points.

Basis of Selectivity: MCPB is not directly toxic to plants. Susceptible weeds convert MCPB to MCPA.

Application Methods: Postemergence. In cereals, clovers and peas, apply as an overall spray. In corn, apply with drop pipes after the corn reaches 45 cm before the beginning of tasselling. Apply to pastures after grazing or cutting.

MECOPROP-P

Trade Names: COMPITOX, MECOPROP.

Chemical Family: Phenoxy.

Crop and/or Non-Crop Registrations: Cereals, turf.

Sensitive Weeds: Many broadleaf weeds such as chickweed, cleavers, plantain, clover, corn spurry, stitchwort, black medick, knotweed, shepherd's-purse, buttercup, Canada thistle (top-growth control) and dandelion. For complete control of Canada thistle, dandelion and black medick, a repeat application will likely be required.

Uptake and Translocation: Absorbed readily by foliage and translocated to roots and throughout shoots, especially to growing points.

Basis of Selectivity: Differences in interception, penetration, translocation, metabolism and sensitivity of active sites result in broadleaf species being more sensitive than grasses.

Application Methods: Postemergence. Apply to cereals between the 3-leaf and early flag-leaf stage. In lawns and turf, apply when weeds are actively growing (May, June and September).

Residual Activity: Can persist in soil up to 4 weeks, however, grass can normally be seeded within 1–2 weeks after treatment.

Unique Characteristics: Controls 2,4-D-resistant weeds such as chickweed, clovers, black medick and young knotweed. Do not spray on grain underseeded to legumes. If cereals are stressed at the time of application, deformed heads and missing florets may result. Can be safely used on bentgrass, however, injury may occur if temperature is above 27°C. Effectiveness

will be reduced if rain occurs within 4–6 hours after treatment.

MECOPROP-P/2,4-D

Trade Names: IPCO PREMIUM 2-WAY XP TURF HERBICIDE, MECOTURF PLUS 2,4-D, TURFRITE 2+2.

Chemical Family: Phenoxy/phenoxy.

Uptake and Translocation: Absorbed through leaves and roots, translocates to growing points.

Basis of Selectivity: Differences in interception, penetration, translocation, metabolism and sensitivity of active sites result in broadleaf species being more sensitive than grasses.

Application Methods: Postemergence. Apply when weeds are actively growing.

MESOTRIONE

Trade Name: CALLISTO.

Chemical Family: Triketone.

Crop and/or Non-Crop Registrations: Corn (field, seed and sweet).

Sensitive Weeds: Annual broadleaf weeds, including triazine and group 2 resistant biotypes.

Uptake and Translocation: Readily absorbed by, shoots, roots, stems and leaves and then translocated to other plant parts.

Basis of Selectivity: Inhibits the HPPD enzyme found in photosynthetic cells of susceptible species. Symptoms on susceptible plants are bleaching followed by necrosis. Tolerant species rapidly metabolize mesotrione.

Application Methods: Preemergence in field, seed and sweet corn. Postemergence up to the 8-leaf stage of field corn only. Postemergence applications require the addition of a non-ionic surfactant.

Residual Activity: Degradation primarily by soil microbial action. Mesotrione will provide residual control of annual broadleaf weeds.

Unique Characteristics: When mesotrione is tank-mixed with atrazine there is a synergistic effect and improved control of broadleaf weed species. Mesotrione can be tank-mixed with either a soil applied

or postemergence grass herbicide for one-pass weed control. Mesotrione has low volatility and poses a reduced risk to nearby sensitive crops.

METAM SODIUM

Trade Name: VAPAM.

Chemical Family: Thiocarbamate.

Crop and/or Non-Crop Registrations: Field and greenhouse seedbeds. Field-replant sites of fruits, vegetables, tobacco, ornamentals and forest-tree stock.

Sensitive Weeds: Most scarified weed seeds and freshly vegetative parts including rhizomes and germinating seedlings.

Basis of Selectivity: Most plant parts are sensitive. Crops are not planted until all fumigant has dissipated from the soil. With moisture, methyl isothiocyanate gas is released, which kills most scarified seeds and fleshy vegetative parts including rhizomes and germinating seedlings.

Application Methods: Apply uniformly using injectors, water or other incorporation tools to carry the product to the desired soil depth. May be applied via the irrigation system. No gas-proof cover is required unless the soil is very porous, however, a sprinkler application of water should be used to provide a surface "water seal".

Residual Activity: 10–40 days depending on soil temperature and the amount of organic matter present in the soil. Persistence is greatest at low temperatures and high levels of organic matter. Planting may take place 12–16 days after the treatment and following a lettuce-seedling bioassay that indicates no injury.

Unique Characteristics: Also controls nematodes, soil fungi and soil insects. All traces of toxic gases must be dissipated from the treated soil before planting or plant injury may occur.

METHYL BROMIDE/CHLOROPICRIN

Trade Name: TERR-O-GAS 67.

Chemical Family: Organohalogen.

Crop and/or Non-Crop Registrations: Greenhouse and tobacco seedbeds. Methyl bromide is very poi-

sonous to humans and livestock; only an experienced operator should attempt its use.

Sensitive Weeds: Gas is toxic to germinating seedlings.

Application Methods: Formulated as a liquid under pressure, that, when released from the container, forms a gas. Soil must be sealed with a plastic sheet since the gas is highly volatile. Refer to label for detailed directions.

Unique Characteristics: Methyl bromide gas is highly volatile and highly poisonous to humans and livestock. It may be absorbed by inhalation, ingestion and skin contact. A permit must be obtained from the Ontario Ministry of the Environment each time it is used. Also controls soil insects, nematodes and fungal diseases.

METOLACHLOR

See S-METOLACHLOR

METOLACHLOR/ATRAZINE

See S-METOLACHLOR/ATRAZINE

METRIBUZIN

Trade Names: CONQUEST A (Available only in CONQUEST co-pack), SENCOR 480 F, SENCOR 75 DF.

Chemical Family: S-triazine.

Crop and/or Non-Crop Registrations: Established asparagus, faba beans, potatoes, soybeans, transplant tomatoes, apples, apricots, peaches, cherries, corn, with trifluralin or with terbacil or with s-metolachlor/benoxacor on apples, apricots, cherries, plums, peaches and pears.

Sensitive Weeds: Lamb's-quarters, wild mustard, red-root pigweed, common ragweed, shepherd's-purse, lady's-thumb, velvetleaf, jimsonweed, prostrate pigweed, Russian thistle, yellow wood-sorrel, prickly mallow, chickweed, cocklebur, carpetweed, dandelion seedlings, barnyard grass, crab grass, foxtail, fall panicum, witch grass, Johnson grass seedlings and cheat grass.

Uptake and Translocation: Some uptake through the foliage but the major route is via the roots. Translocation upwards in the xylem.

Basis of Selectivity: Degradation by tolerant species.

Application Methods: Preplant incorporated (potatoes, soybeans, apples, apricots, peaches, cherries, corn, tomatoes and triazine-tolerant canola); preemergence (asparagus, potatoes, soybeans and triazine-tolerant canola); postemergence (potatoes, tomatoes, corn and triazine-tolerant canola).

Residual Activity: Varies with the climate. At normal-use rates the half-life is 1–2 months.

Unique Characteristics: Heavy rainfall following application may cause crop damage. Some varieties of potato, soybean and tomato are less tolerant than others. Triazine-resistant weeds are not controlled. Do not use on muck soils.

METRIBUZIN + S-METOLACHLOR

Trade Name: BOUNDARY (co-pack of SENCOR DF SOYBEAN + DUAL MAGNUM SOYBEAN).

Chemical Family: S-triazine+Acetanilide.

Crop and/or Non-Crop Registrations: Soybeans.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled.

Application Methods: Preplant incorporated and preemergence.

Unique Characteristics: Refer to notes on s-metolachlor and metribuzin for additional information on each component.

NAPROPAMIDE

Trade Names: DEVRINOL 50 DF, DEVRINOL 2G, DEVRINOL 10G.

Chemical Family: Amide.

Crop and/or Non-Crop Registrations: Asparagus, cole crops (cabbage, broccoli, cauliflower, Chinese broccoli, Chinese mustard greens, Chinese Nappa cabbage, Chinese radish), garlic, kohlrabi, peppers, pumpkin, squash, fuzzy squash, rutabagas, tomatoes, tobacco, raspberries, blackberries, cultivated lowbush blueberries, established highbush blueberries, boysenberries, cranberries, loganberries, newly

planted or established strawberries, apples, grapes, peaches and pears, newly transplanted or established ornamentals, woody nursery stock, forest tree stock and container-grown ornamentals (see label for species). With simazine or with terbacil on new plantings of apples, apricots, cherries, plums, peaches and pears.

Sensitive Weeds: Many annual weeds including crab grass, barnyard grass, annual bluegrass, foxtails, sandbur, wild oats, goose grass, chickweed, groundsel, redroot pigweed, lamb's-quarters, purslane, prostrate knotweed, pineappleweed and prickly lettuce.

Uptake and Translocation: Absorbed through the roots of germinating weeds. Translocated upward through seedling.

Basis of Selectivity: Metabolized by tolerant species. Root growth of germinating seedlings is inhibited. Established plants are not affected due to placement selectivity.

Application Methods: May be applied preplant incorporated using water as the carrier. Incorporation should be uniform, and to a chemical depth of 2.5–5 cm, using irrigation or proper incorporation equipment (e.g., tandem discs or field cultivator with sweep teeth) followed by a levelling device. On established crops, apply to a weed-free soil surface and irrigate in if no rainfall occurs within 7 days after application in spring or fall, or within 2 days after application in summer; irrigate with sufficient water to wet the soil to a depth of 5–10 cm (approximately 7 mm of rain). For post-plant application in tobacco, apply in 25 cm band over the row. Cross-disc or cross-plough after harvest to dilute soil residue before planting cover crop.

Residual Activity: Provides season-long weed control if properly incorporated. Deep ploughing will minimize any carryover effect.

Unique Characteristics: Will not control germinated weeds. Resists leaching. To avoid injury to crops not registered for use with napropamide, do not plant until 12 months after the last napropamide application.

NAPTALAM

Trade Name: ALANAP.

Chemical Family: Amide.

Crop and/or Non-Crop Registrations: Cucumbers, melons, squash and pumpkins.

Sensitive Weeds: Seedlings of bindweed, chickweed, cocklebur, lamb's-quarters, pigweed, purslane, ragweed, velvetleaf, crab grass and foxtail.

Uptake and Translocation: Inhibits seed germination and may be absorbed through the root system after germination.

Application Methods: Preemergence. Thoroughly break up soil clods and pulverize to give a smooth surface before applying spray. Apply up to 48 hours after planting. Following applications, do not disturb the soil unless later weed growth makes cultivation necessary. A second application may be applied to cucumbers and melons about 1 month after the first spray, when the crop has emerged but before the weeds are up. Use lower rates on light soil, higher rates on heavy soil.

Residual Activity: Completely decomposes in 6–8 weeks.

Unique Characteristics: Do not apply during very wet, cold weather as stunting of the crop may result. Avoid spray drift to areas planted to sensitive crops such as beets, tomatoes and spinach.

NICOSULFURON

Trade Name: ACCENT.

Chemical Family: Sulfonyleurea.

Crop and/or Non-Crop Registrations: Field corn, certain varieties of sweet corn (refer to product label), and seed corn (contact seed source for details on specific inbreds).

Sensitive Weeds: Quack grass, proso millet, green and yellow foxtail, fall panicum, barnyard grass, witch grass. Control of yellow foxtail is only achieved with either the addition of MERGE or the addition of 28% UAN at a rate of 5 L/ha along with the recommended non-ionic surfactant.

Uptake and Translocation: Following foliar absorption, nicosulfuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and regrowth. Tolerant species rapidly convert nicosulfuron to non-phytotoxic metabolites.

Application Method: Postemergent within the 1 to 8-leaf stage of corn.

Residual Activity: No soil residual activity.

Unique Characteristics: Emerged grasses will be controlled by nicosulfuron but subsequent germinating grasses will not be controlled. A non-ionic surfactant must be added at 0.2% v/v. Typical symptoms of plant death (chlorosis, necrosis) occur 5–10 days after application, depending on growing conditions. Do not apply to corn that has been treated with an organophosphorus soil insecticide.

NICOSULFURON + DIFLUFENZOPYR/DICAMBA

Trade Name: ACCENT TOTAL (co-pack of ACCENT + DISTINCT).

Chemical Family: Sulfonyleurea + Semicarbazone/ Benzoic acid.

Crop and/or Non-Crop Registrations: Corn.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled.

Uptake and Translocation: Refer to notes on nicosulfuron and diflufenzopyr/dicamba for additional information on each component.

Basis of Selectivity: Refer to notes on nicosulfuron and diflufenzopyr/dicamba for additional information on each component.

Application Methods: Postemergent, from the 2 to 8-leaf stage of corn.

Unique Characteristics: Refer to notes on nicosulfuron and diflufenzopyr/dicamba for additional information on each component.

NICOSULFURON + PROSULFURON/DICAMBA

Trade Name: ACCENT 1-PASS (co-pack of ACCENT + PEAKPLUS).

Chemical Family: Sulfonylurea + Sulfonylurea/Benzoic acid.

Crop and/or Non-Crop Registrations: Corn.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled. For improved yellow foxtail control refer to notes under nicosulfuron.

Uptake and Translocation: Refer to notes on nicosulfuron and prosulfuron/dicamba for additional information on each component.

Basis of Selectivity: Refer to notes on nicosulfuron and prosulfuron/dicamba for additional information on each component.

Application Methods: Postemergent, up to the 7-leaf stage of corn.

Unique Characteristics: Refer to notes on nicosulfuron and prosulfuron/dicamba for additional information on each component.

NICOSULFURON/RIMSULFURON

Trade Name: ULTIM.

Chemical Family: Sulfonylurea/Sulfonylurea.

Crop and/or Non-Crop Registrations: Field corn. Not for use on sweet or seed corn.

Sensitive Weeds: Quack grass, proso millet, green and yellow foxtail, fall panicum, barnyard grass, witch grass, redroot pigweed (incl. triazine-resistant).

Uptake and Translocation: Following foliar application, nicosulfuron/rimsulfuron rapidly absorbed through the leaves and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert nicosulfuron/rimsulfuron to non-phytotoxic metabolites.

Application Method: Postemergent, within the 1- to 6-leaf stage of corn.

Residual Activity: Rapid soil microbial degradation of nicosulfuron. Refer to notes on rimsulfuron for information on its soil residual activity.

Unique Characteristics: Emerged grasses will be controlled by nicosulfuron/rimsulfuron, but subsequent germinating grass weeds will not be controlled. A non-ionic surfactant must be added at 0.2% v/v. Typical symptoms of plant death (chlorosis, necrosis) occur 5–10 days after application, depending on growing conditions. Do not use on corn hybrids with a crop heat unit (CHU) rating of 2,500 or less, or in geographic regions with 2500 or less average seasonal CHU.

NICOSULFURON/RIMSULFURON + DIFLUFENZOPYR/DICAMBA

Trade Name: ULTIM TOTAL (co-pack of ULTIM + DISTINCT).

Chemical Family: Sulfonylurea + Semicarbazone/Benzoic acid.

Crop and/or Non-Crop Registrations: Corn.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled.

Uptake and Translocation: Refer to notes on nicosulfuron/rimsulfuron and diflufenzopyr/dicamba for additional information on each component.

Basis of Selectivity: Refer to notes on nicosulfuron and diflufenzopyr/dicamba for additional information on each component.

Application Methods: Postemergent, up to the 6-leaf stage of corn.

Residual Activity: Rapid soil microbial degradation of nicosulfuron. Refer to notes on rimsulfuron for information on its soil residual activity.

Unique Characteristics: Refer to notes on nicosulfuron/rimsulfuron and diflufenzopyr/dicamba for additional information on each component.

OXADIAZON

Trade Name: RONSTAR 2G.

Chemical Family: Oxadiazole.

Crop and/or Non-Crop Registrations: Woody ornamental shrubs, vines and trees grown in containers.

Sensitive Weeds: Annual weeds including stinkweed, bittercress, common groundsel, lamb's-quarters, purslane, black nightshade, pigweeds, redroot, tumble, shepherd's-purse, annual bluegrass, barnyard grass, green and yellow foxtails and crab grass.

Uptake and Translocation: Primarily taken up through emerging shoots when they penetrate through the treated soil layer.

Basis of Selectivity: Greater physiological tolerance relative to susceptible species and lack of contact with sensitive crop tissue.

Application Method: Applications may be made to both newly transplanted and established ornamentals preemergent to weed germination. Existing weed growth must be removed for satisfactory weed control.

Residual Activity: 60–120 days.

Unique Characteristics: When applied to soil, the material is rapidly and strongly fixed by soil colloids. Due to its low water solubility and to this adsorption, the downward and lateral movement is limited under the influence of rain or irrigation. Therefore, the chemical must be applied uniformly for satisfactory weed control. Moisture is required to activate the chemical. Rainfall or overhead irrigation after application will improve weed control.

OXYFLUORFEN

Trade Name: GOAL.

Chemical Family: Diphenyl ether.

Crop and/or Non-Crop Registrations: Onions, strawberries.

Sensitive Weeds: Purslane, pigweed, annual nightshades, wild buckwheat, lamb's-quarters, field violet, wood-sorrels.

Uptake and Translocation: Primarily foliar absorption but some root absorption. Very little movement within the plant following foliar or root absorption.

Application Methods: Postemergence. Best control is obtained when weeds are in the 2- to 4-leaf stage and actively growing. The first application can be made when onions have 2 fully developed true leaves. Repeat applications may be necessary to control late-germinating weeds. Apply as a single pre-mulching

spray to dormant strawberry plants. Use at least 500 L of water/ha.

Residual Activity: Limited preemergence activity.

Unique Characteristics: Use on dry bulb onions. Do not use when crop or weeds are under stress. Do not apply within 56 days prior to harvest for onions, or within 150 days prior to harvest for strawberries.

PARAQUAT

Trade Name: GRAMOXONE.

Chemical Family: Bipyridylum.

Crop and/or Non-Crop Registrations: Apples, apricots, cherries, currants, gooseberries, grapes, highbush blueberries, peaches, pears and plums established more than 1 year; blackberries, loganberries and red raspberries; inter-row spraying in strawberries; stale seedbed technique for vegetables and field crops; inter-row directed chemical weeding for vegetable fields and established nursery crops; asparagus; potatoes; established alfalfa and bird's-foot trefoil; pasture renovation; zero tillage corn; conifer control.

Sensitive Weeds: Non-selective – affects all green plants.

Uptake and Translocation: Absorbed by foliage and green bark; little or no translocation.

Basis of Selectivity: All green plant tissue is sensitive. Less effective on plants with a very waxy cuticle and linear leaf shape such as nut sedge. Safe on mature (non-green) bark of woody plants.

Application Methods: Postemergence. Broadcast, or directed spray to avoid contacting leaves or bark of desirable plants. Apply when weeds are less than 15 cm high. Better results are usually obtained if application is made on a dull or cloudy day, or in the evening.

Residual Activity: Essentially no residual activity in soil. Will persist in organic material such as mulches or turf thatch; therefore, do not reseed these areas for 5 days. More than 1 application per season may be necessary, especially for perennial weeds.

Unique Characteristics: Inactivated by adsorption to soil particles. Not available to homeowners. For a domestic registration, see PARAQUAT/DIQUAT.

PARAQUAT/DIQUAT

Trade Names: WEED AND GRASS KILLER, WEED-BAN.

Chemical Family: Bipyridylum/bipyridylum.

Crop and/or Non-Crop Registrations: "Chemical mower" to control weeds on driveways, pathways and other non-cultivated areas.

Sensitive Weeds: All green plant tissue. Less effective on plants with a thick, waxy cuticle such as nut sedge.

Uptake and Translocation: Foliar contact activity. Little or no translocation.

Basis of Selectivity: No selectivity for green plants. Will not penetrate the mature (non-green) bark of woody plants.

Application Method: Postemergence.

Residual Activity: Essentially none; inactivated by adsorption to soil particles. May remain active in turf thatch after application, therefore, thorough cultivation of a turf area is required before seeding.

Unique Characteristics: Best results follow application on dull or cloudy days, or in the evening.

PENDIMETHALIN

Trade Name: PROWL.

Chemical Family: Dinitroaniline.

Crop and/or Non-crop Registrations: Onions and field corn.

Sensitive Weeds: Green foxtail, yellow foxtail, crab grass, barnyard grass, fall panicum, common chickweed, lamb's-quarters and pigweed.

Uptake and Translocation: Weeds are controlled as they germinate. Translocation is not significant and emerged weeds are not controlled.

Basis of Selectivity: No significant uptake or translocation by the crop.

Application Methods: Onions: postemergence to the crop at loop and 2-leaf stage. Field corn: preemergence and early postemergence. For preemergence application, pendimethalin may be applied in water or liquid fertilizer. Conduct a fertilizer compatibility test using pendimethalin and any of its registered

tank-mix partners. Early postemergence application may only use water as a carrier.

Residual Activity: Persistence depends on weather conditions (more persistent under dry conditions). Only registered crops may be planted in the year of application. Soybeans and corn may be planted the year following application in corn. Days to harvest restriction: 100 days.

Unique Characteristics: Strongly adsorbed to soil particles. Most effective when rain is received within 7 days of application. For onions, apply at both growth stages for season-long control. Tank-mixes in corn or sequential application of other herbicides in onions and corn are required for broad-spectrum weed control. Registered for dry bulb onions grown on muck and mineral soils. Do not graze treated fields or feed treated foliage to livestock prior to 100 days after PROWL application.

PICLORAM/2,4-D

Trade Name: TORDON 101 MIXTURE.

Chemical Family: Pyridine/phenoxy.

Crop and/or Non-Crop Registrations: Weed and brush (including conifer) control in non-crop locations, industrial sites and rights-of-way.

Sensitive Weeds: Most broadleaf herbaceous weeds including Canada thistle, sweet and red clover, wild carrot, common ragweed, dandelion, goldenrod, dock, plantain, prickly lettuce, burdock, fleabane and vetch; deciduous and coniferous woody plants except white ash.

Uptake and Translocation: Rapidly absorbed by the roots, stems and foliage. Translocation can be up or down but, like 2,4-D, accumulation is in young, rapidly growing meristematic tissue.

Basis of Selectivity: Effects on nucleic acid metabolism and growth are not observed in grasses and other tolerant species.

Application Methods: For deciduous and coniferous brush, apply either broadcast using a fixed nozzle (constant volume per hectare) or selectively using a spray gun (variable volume per hectare). As spray gun applications use a more dilute spray mix, this

type of application must thoroughly wet the foliage, stem and root collar. Brush should be treated after foliage is well developed in spring or early summer. To ensure thorough coverage and minimize drift, brush to be treated should be less than 2.5 m tall. For cut-surface treatment, mix with water or ethylene glycol (to reduce the freezing point, if necessary) and apply to cover the cambium layer of freshly cut stumps. For broadleaf herbaceous weeds, apply broadcast in spring or early summer after growth begins.

Residual Activity: Soil residue carryover into the year following application is minimal when applied at recommended rates. Degradation is most rapid under warm, humid conditions. Because small residues of picloram in soil can be phytotoxic to crops such as soybeans, tobacco, tomatoes, potatoes, grapes and many desirable ornamental plants, picloram may not be applied to land used, or land that may be used, for the production of agricultural and horticultural crops.

Unique Characteristics: A permit from the Ministry of the Environment is required to purchase and use picloram/2,4-D in Ontario. Picloram/2,4-D must not be applied over, or near, areas where roots of desirable trees or other plants may extend. Because spray drift is phytotoxic to sensitive plants, an approved drift-control system or additive is recommended when making low-volume applications adjacent to desirable trees or crops.

PRIMISULFURON/DICAMBA

Trade Name: SUMMIT.

Chemical Family: Sulfonyle urea/benzoic acid.

Crop and/or Non-Crop Registrations: Field corn.

Sensitive Weeds: Quack grass, lamb's-quarters (including triazine tolerant), redroot pigweed, mustards, common ragweed, velvetleaf.

Uptake and Translocation: Following foliar application and uptake, translocation through the phloem to meristematic tissues.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence, within the 2- to 7-leaf stages of corn.

Residual Activity: Degradation primarily by soil microbial activity. Will provide some control of later germinating broadleaf weeds. See the label and Tables 4-3, page 60 and 4-4, page 62 for rotational restrictions.

Unique Characteristics: Will control quack grass and broadleaf weeds. An adjuvant must be added at 0.2% v/v. Apply when temperature, during the 24 hours before and after the application, ranges between 5°C and 28°C. Do not use on seed or sweet corn. Do not apply to corn treated with an organophosphate insecticide.

PROMETRYNE

Trade Name: GESAGARD

Chemical Family: S-triazine.

Crop and/or Non-Crop Registrations: Carrots, peas, leeks, and transplanted celery.

Sensitive Weeds: Lamb's-quarters, lady's-thumb, corn spurry, pigweed, wild mustard, purslane, eastern black nightshade, chickweed, hemp-nettle and green foxtail.

Uptake and Translocation: Absorbed through foliage and roots. Translocated upwards through xylem, accumulating in the apical meristems.

Basis of Selectivity: Metabolized by tolerant plants and to a lesser extent by sensitive plants, although this is not thought to be the major selective mechanism.

Application Methods: Preemergence or early postemergence (before weeds are 5 cm high). Apply before carrots or peas emerge. Apply 7-14 days after celery is transplanted.

Residual Activity: About 6-8 weeks. A fall cover crop of rye or oats may be sown on the treated land in the same season.

PROPYZAMIDE

Trade Name: KERB.

Chemical Family: Amide.

Crop and/or Non-Crop Registrations: Alfalfa, bird's-foot trefoil, woody nursery stock, lettuce, apples, pears, lowbush blueberries.

Sensitive Weeds: Perennial grasses including quack grass, annual grasses, volunteer cereals and common chickweed.

Uptake and Translocation: Taken up by plant roots and translocated to the foliage. Little foliar absorption.

Basis of Selectivity: Faster degradation in tolerant species.

Application Methods: Preemergence to annual weeds. Postemergence control of perennial grasses when applied in the fall. Apply in the fall from late September to early November when the soil temperature is low but above freezing, and soil moisture is high.

Residual Activity: Persistence is variable (2-9 months), depending on soil type and climatic conditions. Decomposition of the herbicide is slow at temperatures below 15°C but accelerates at temperatures above this level. Persistence is greatest in sandy soils with low organic matter.

Unique Characteristics: Rainfall or irrigation is required after application to move the herbicide into the root zone for uptake by perennial grasses and germinating annual grasses.

PROSULFURON

Trade Name: PEAK.

(Available only in PEAKPLUS co-pack)

PROSULFURON/DICAMBA

Trade Name: PEAKPLUS.

(co-pack of PEAK + BANVEL II).

Chemical Family: Sulfonyle urea+benzoic acid.

Crop and/or Non-Crop Registrations: Field corn.

Sensitive Weeds: Lamb's-quarters (including triazine tolerant), redroot pigweed, cocklebur, lady's thumb, wild mustard, velvetleaf, common ragweed.

Uptake and Translocation: Following foliar application and uptake, prosulfuron is translocated through phloem to meristematic tissues. Growth of susceptible species ceases rapidly, followed by discolouration of leaves; death takes 1-3 weeks to occur.

Basis of Selectivity: Inhibition of the enzyme acetolactate synthase. Tolerant species rapidly metabolize prosulfuron.

Application Methods: Postemergent, within the 2- to 7-leaf stages of corn.

Residual Activity: Degradation primarily by soil microbial action. Prosulfuron will provide a sufficient degree of control of later germinating broadleaf weeds. Approved rotational crops are soybeans, dry beans, peas, cereals, and corn. See the label and Table 4-3. *Herbicide Crop Rotation and Soil pH Restrictions*, page 60 and Table 4-4. *Herbicide Crop Rotation and Soil pH Restrictions*, page 62 for rotational restrictions.

Unique Characteristics: Prosulfuron must be applied in a tank-mix combination with a reduced rate of dicamba. Refer to the corn recommendation section for products and rates. An adjuvant must be added at 0.2% v/v. Do not apply to corn treated with a granular organophosphate insecticide.

PYRASULFOTOLE/BROMOXYNIL

Trade Name: Infinity

Chemical Family: Benzoylpyrazole and Hydroxybenzonitrile.

Crop and/or Non-Crop Registrations: Wheat (spring, durum winter), barley, triticale and timothy (seed production only).

Sensitive Weeds: Annual broadleaf weeds including ALS (Group 2) resistant biotypes: annual sow thistle, chickweed, cleavers, flixweed, hemp-nettle, kochia, lamb's-quarters, pale smartweed, redroot pigweed, Russian thistle, shepherd's purse, stinkweed, volunteer canola (conventional and herbicide tolerant), wild buckwheat and wild mustard. Suppression of perennial weeds including: Canada thistle, Dandelion, Perennial sow-thistle.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Postemergence – Apply to emerged, young, actively growing weeds. Under cool and/or dry conditions activity may be reduced or delayed. Weed control may also be reduced if application is made when weeds are dust covered or in the presence of heavy dew, fog, or mist/rain. Apply in a minimum of 46.8 L of water/ha at a pressure of 275 kPa. Crops may be treated from the 1 leaf stage of growth until the flag leaf is just visible but still rolled.

Residual Activity: Essentially none.

Unique Characteristics: Application beyond emergence of the flag leaf may result in crop injury. Do NOT apply to a crop that is stressed by severe weather conditions, frost, low fertility, drought, water-saturated soil, disease or insect damage, as crop injury may result. Do NOT apply to crops undersown with legume species. Do not store below -20°C.

PYRAZON

Trade Name: PYRAMIN FL.

Chemical Family: Pyridazinone.

Crop and/or Non-Crop Registrations: Sugar beets and table beets. With NORTRON on sugar beets.

Sensitive Weeds: Annual nightshades, chickweed, knotweed, lady's-thumb, lamb's-quarters, oak-leaved goosefoot, prostrate pigweed, purslane, ragweed, redroot pigweed, shepherd's-purse, smartweed, stinkweed, wild buckwheat, wild carrot (seedling), wild mustard, wormseed mustard and yellow rocket (seedling).

Uptake and Translocation: Can be taken up by both roots and leaves, but translocation is upward to leaves where it inhibits photosynthesis.

Basis of Selectivity: Metabolism by tolerant species.

Application Methods: Preplant incorporated, preemergence, or postemergence after the second true-leaf stage of the beets.

Residual Activity: Average persistence is about 4–8 weeks in soil, depending on soil moisture and temperature. Residue carryover problems are unlikely.

Unique Characteristics: With preemergence applications, at least 1.25 cm of rainfall is required for good weed control. Combinations of pyrazon and TCA are most useful where both annual broadleaf weeds and grasses are a problem. These treatments may not be effective on high organic soils or dry soils (i.e., muck soils or with late planted beets when soils are drier). Under these circumstances, postemergence applications of pyrazon plus TCA as a band over the row may be most effective. However, to be selective and effective the chemicals must be applied after the cotyledons of the beets are 2.5 cm long and before

the weeds have reached the 4 true-leaf stage (10 cm). Where TCA has been used, do not feed beet tops to livestock. TCA residues in the soil can be a problem for some crops such as corn.

QUIZALOFOP-P-ETHYL

Trade Name: ASSURE II.

Chemical Family: Aryloxyphenoxypropionate.

Crop and/or Non-Crop Registrations: Canola, flax, a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations, peas, rutabagus, industrial fibre hemp, seed alfalfa, soybeans and sugar beets.

Sensitive Weeds: Green foxtail, barnyard grass, fall panicum, witch grass, proso millet, wild oats, volunteer cereals and volunteer corn.

Uptake And Translocation: Rapidly absorbed and readily translocated in both the xylem and phloem from the treated foliage to the root system and growing points of the plant.

Basis of Selectivity: Disruption of fatty acid biosynthesis leading to increased permeability and cellular disruption in sensitive plants. Rapid metabolism of the active herbicide in tolerant species.

Application Methods: Postemergence.

Residual Activity: Rapid microbial degradation and essentially no soil activity.

Unique Characteristics: Apply with CANPLUS-411 at 5–10 L/1000 L of spray solution or SURE-MIX at 5 L/1000 L of spray solution.

RIMSULFURON

Trade Name: ELIM EP (available only in BATTALION and GALAXY co-packs), PRISM.

Chemical Family: Sulfonyleurea.

Crop and/or Non-Crop Registrations: ELIM EP – Field corn. Not for use on sweet or seed corn. PRISM – Potatoes, transplanted processing tomatoes. Not for use on potatoes grown for seed.

Sensitive Weeds: Green foxtail, fall panicum, barnyard grass, redroot pigweed (incl. triazine-resistant), hairy nightshade, Suppression of yellow foxtail, witch grass, lamb's-quarters.

Uptake and Translocation: Following foliar application, rimsulfuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert rimsulfuron to non-phytotoxic metabolites.

Application Method: Postemergent, within the spike 3-leaf stage of corn. Prior to initiation of flowering in potatoes.

Residual Activity: Provides season long control of labeled weeds to canopy closure.

Unique Characteristics: See nicosulfuron/rimsulfuron.

RIMSULFURON + GLYPHOSATE

Trade Name: GALAXY (co-pack of ELIM EP + ROUNDUP WEATHERMAX).

Chemical Family: Sulfonyleurea + Amino acid.

Crop and/or Non-Crop Registrations: Glyphosate Tolerant (Roundup Ready) Corn only.

Sensitive Weeds: Annual grass and broadleaf species. See label for specific species controlled.

Uptake and Translocation: Refer to notes on rimsulfuron and glyphosate for additional information on each component.

Basis of Selectivity: Refer to notes on rimsulfuron and glyphosate for additional information on each component.

Application Methods: Postemergent, up to the 6-leaf stage of corn.

Unique Characteristics: Refer to notes on rimsulfuron and glyphosate for additional information on each component.

RIMSULFURON + S-METOLACHLOR + DICAMBA

Trade Name: BATTALION (co-pack of ELIM EP + DUAL II MAGNUM + BANVEL II).

Chemical Family: Sulfonyleurea + Acetanilide + Benzoic acid.

Crop and/or Non-Crop Registrations: Corn.

Sensitive Weeds: Annual grass and broadleaf species, suppression of quackgrass. See label for specific species controlled.

Uptake and Translocation: Refer to notes on rimsulfuron, s-metolachlor and dicamba for additional information on each component.

Basis of Selectivity: Refer to notes on rimsulfuron, s-metolachlor and dicamba for additional information on each component.

Application Methods: Preemergent and postemergent up to the 3-leaf stage of corn.

Residual Activity and Unique Characteristics: Refer to notes on rimsulfuron, s-metolachlor and dicamba for additional information on each component.

SCLEROTINIA MINOR (STRAIN IMI 344141)

Trade Names: SARRITOR GRANULAR BIOLOGICAL HERBICIDE.

Crop and/or Non-Crop Registrations: Turfgrass.

Sensitive Weeds: Dandelion.

Uptake and Translocation: The active ingredient, Sclerotinia minor is a naturally occurring fungus that when applied to dandelion will grow into the weed and absorb plant tissue until the weed is controlled.

Application Methods: Postemergence. Apply when daytime high temperatures are 18–24°C and when rainfall occurs within 12 hours of application.

Residual Activity: Essentially none, will not control un-emerged dandelion.

Unique Characteristics: SARRITOR will usually take between 5–7 days to suppress/control dandelion. This product will not affect grass species, but severe damage to non-target desirable broadleaf plant species may occur if SARRITOR comes in contact.

S-METOLACHLOR

Trade Names: DUAL MAGNUM, DUAL II MAGNUM.

Chemical Family: Acetanilide.

Crop and/or Non-Crop Registrations: Corn, soybeans, a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registra-

tions, transplanted cole crops (cabbage, cauliflower, broccoli), transplanted tomatoes, potatoes, sugar beets, processing peas, rutabagas and sweet white lupins, apples, apricots, cherries, peaches, pears and plums.

Sensitive Weeds: Large and smooth crab grass; witch grass; barnyard grass; fall panicum; giant, green and yellow foxtail; yellow nut sedge; American nightshade, eastern black nightshade and tall waterhemp.

Uptake and Translocation: Absorbed by germinating grasses mainly through shoot just above seed. Absorbed by germinating broadleaf weeds through roots and shoots.

Basis of Selectivity: Metabolized by tolerant species.

Application Methods: Early preplant, preplant incorporated and preemergence. Early postemergence on corn (spike to 2-leaf stage of corn). Incorporation equipment should be set to work the soil 10 cm deep with a disc operating at 6–10 km/hr or a vibrating shank cultivator at 10–13 km/hr; 1 incorporation is sufficient and need not be immediate. Rainfall within 10 days is required for maximum activity of the preemergence application.

Residual Activity: Activity will normally be maintained for 10–14 weeks.

Unique Characteristics: The rate required depends on weed pressure (higher rate for heavier weed pressure). Yellow nut sedge control requires a preplant incorporated application. Winter cereals may be planted 4–5 months after metolachlor application. Many tank-mix combinations are registered on various crops. Do not use on muck soils or coarse-textured soils low in organic matter. DUAL II MAGNUM contains benoxacor, a chemical that enhances the corn plant's ability to metabolize s-metolachlor, thereby preventing corn injury even under adverse environmental conditions.

S-METOLACHLOR/ATRAZINE

Trade Name: PRIMEXTRA II MAGNUM.

Chemical Family: Acetanilide/s-triazine.

Crop and/or Non-Crop Registrations: Corn (ensilage, field, seed and sweet).

Sensitive Weeds: Germinating annual broadleaf weeds and annual grasses such as American nightshade, eastern black nightshade, lady's-thumb, lamb's-quarters, wild mustard, purslane, prostrate pigweed, red-root pigweed, wild buckwheat, smartweed, ragweed, crab grass, barnyard grass, green foxtail, yellow foxtail, giant foxtail, witch grass and fall panicum. Yellow nut sedge can be controlled with a preplant incorporated application.

Uptake and Translocation: Absorbed by germinating grasses mainly through shoot just above seed. Absorbed by germinating broadleaf weeds through roots and shoot.

Basis of Selectivity: Metabolized by tolerant species.

Application Methods: Early preplant, preplant incorporated, and preemergence. Early postemergence on corn (spike to 2-leaf stage of corn. Incorporation equipment should be set to work the soil 10 cm deep with a disc operating at 6–10 km/hr or a vibrating shank cultivator at 10–13 km/hr.). One incorporation is sufficient and need not be immediate. Rainfall within 10 days is required for maximum activity of the preemergence application. S-metolachlor/atrazine may be applied in nitrogen solutions or liquid fertilizers for preplant incorporated or preemergence weed control. Dry bulk granular fertilizers may be impregnated with metolachlor/atrazine for preplant incorporation.

Residual Activity: Activity will normally be maintained for 10–14 weeks; late-germinating fall panicum will not be controlled. Soybeans, white beans, oats or barley may be planted the following spring.

Unique Characteristics: The rate required depends on weed pressure (higher rate for heavier weed pressure. Yellow nut sedge control requires a preplant incorporated application. Will not control triazine-resistant weed species. Contains atrazine in low amounts, which may carry over in a dry year. Is

effective over a wide range of soil types and has a good margin of crop safety. Perennial weeds are not controlled. Primextra II MAGNUM contains benoxacor, a chemical that enhances the corn plant's ability to metabolize s-metolachlor, thereby preventing corn injury even under adverse environmental conditions.

SETHOXYDIM

Trade Name: POAST ULTRA.

Chemical Family: Cyclohexanedione.

Crop and/or Non-Crop Registrations: Canola (rape-seed), flax, soybeans, a number of different edible bean market classes, refer to Table 7-1, page 85 for specific crop registrations peas, onions, tomatoes, potatoes, sweet potato, pumpkin, squash, cucumbers, alfalfa, buckwheat, creeping red fescue, garlic, broccoli, cabbage, cauliflower, peppermint, spearmint, snow peas, apples, apricots, cherries, peaches, pears, plums, highbush blueberries, cranberries, strawberries and sethoxydim-resistant corn.

Sensitive Weeds: Annual grasses (wild oats, foxtails, barnyard grass, large crab grass, proso millet, fall panicum and witch grass), volunteer corn and cereals and quack grass.

Uptake and Translocation: Absorbed by foliage. Translocated upwards and downwards in plant.

Basis of Selectivity: Degraded by tolerant species (broadleaf plants).

Application Methods: Postemergence to actively growing annual grasses in the 1- to 6-leaf stage and quack grass in the 1- to 3-leaf stage. Use flat fan nozzles and add MERGE adjuvant to the spray mix. Alternatively, ASSIST OIL CONCENTRATE or Ammonium sulphate plus ASSIST OIL CONCENTRATE may be used. Other postemergence herbicides not recommended as tank-mix combinations on the label must be applied at least 4 days before or after sethoxydim application. Aerial application is also registered.

Residual Activity: Essentially none. A second application and/or cultivation may be necessary to control grasses that emerge after treatment.

Unique Characteristics: Susceptible grasses, when sprayed, stop growing immediately and then gradually turn yellow to purple to brown over a period of 7–21 days, depending on growing conditions and crop competition. Rainfall within 1 hour after application may reduce effectiveness. If treated grasses are stressed (drought, flooding, prolonged cool temperatures) control will be delayed or reduced.

SIMAZINE

Trade Names: PRINCEP NINE-T, SIMADEN, SIMAZINE 480.

Chemical Family: S-triazine.

Crop and/or Non-Crop Registrations: Corn, established asparagus, bird's-foot trefoil, raspberries, loganberries, blackberries, highbush blueberries, alfalfa, apples, apricots, cherries, peaches, pears and plums established for 1 year or more; grapes established for 3 or more years; shelterbelts established for at least one growing season (caragana, green ash, Siberian elm, American elm and Manitoba maple); new or established Christmas tree and woodland plantations (2 years or older white pine and balsam fir); woody ornamentals and nursery stock established for at least 1 year (cedar, barberry, apple, flowering crab apple, box wood, cotoneaster, dogwood, holly, rose, yews, chamaecyparis, hemlock, juniper, multiflora rose, peony; spruce, mugho pine, black walnut and white ash); nursery container stock (cedar, juniper, yew); aquatic weed control; non-cropland. Conifer site preparation before planting of fir, pine and spruce (Princep Nine-T only).

Sensitive Weeds: Annual broadleaf weeds such as pigweed, lady's-thumb, lamb's-quarters, purslane, ragweed, volunteer clover, wild buckwheat, smartweed, plantain and groundsel; annual grasses such as barnyard grass, crab grass, wild oats and yellow foxtail (triazine-resistant biotypes of foxtail, lamb's-quarters, pigweed and groundsel will not be controlled); most perennial species starting freshly from seed.

Uptake and Translocation: Absorbed by roots; little or no foliar absorption; translocated upwards in xylem, accumulating in apical meristem and leaves with

napropamide on new plantings of apples, apricot, cherries, plums, peaches and pears.

Basis of Selectivity: Some species, such as corn, metabolize simazine. In most crops, selectivity is based on the roots of the crop plants being deeper than the depth to which simazine leaches.

Application Methods: Preplant incorporated (to a depth of 2.5 cm) or preemergence in corn; preemergence in other crops. Broadcast or band application. In fruit crops, apply a 1 m wide band under the plants; cultivate or sod the area between the rows. For aquatic weed control, apply as a draw-down treatment or water-volume application in drainage ditches and ponds with no water flow-through.

Residual Activity: Soil residues may persist for more than 1 season. After spraying with simazine, do not plant any crop in the treated area in the same year except corn. Where rates in excess of 2 kg/ha have been applied, do not plant rotational crops in the following year; soils should be tested if there is any question of excessive residues remaining.

Unique Characteristics: Needs sufficient moisture to be activated. Should be applied only once per season. To avoid build-up of resistant weeds, simazine should be rotated with other non-triazine residual herbicides. Simazine is more persistent than atrazine. Where rainfall is sufficient to cause erosion, soil containing simazine may wash to lower areas of land and injure existing or subsequent crops.

SURFACTANT

See Chapter 5, *Notes on Adjuvants*, page 67.

TERBACIL

Trade Name: SINBAR.

Chemical Family: Uracil.

Crop and/or Non-Crop Registrations: apples, apricots, cherries, highbush blueberries, peaches, pears, plums, spearmint, peppermint, and strawberries; with napropamide on new plantings of apples, apricots, cherries, plums, peaches and pears.

Sensitive Weeds: Barnyard grass, bluegrass, crab grass, foxtail, chickweed, cheat grass, perennial ryegrass,

wild barley, mustard, prickly lettuce, stinkweed, annual sow-thistle, henbit, lamb's-quarters, pigweed, purslane and ragweed. Partial control of quack grass, horsetail, vetch and yellow nut sedge.

Uptake and Translocation: Uptake is mostly through roots, although partially through foliage and stem. Translocation is upward into leaves.

Basis of Selectivity: Used only on established plantings so that roots of crop are below depth to which chemical penetrates. May also be slower translocation and faster degradation in tolerant species.

Application Methods: Apply to the soil surface in 200–1,000 L water/ha. If weed growth is present in apples, paraquat may be mixed with spray. Rates for strawberries are considerably lower and can be applied in spring, postharvest or late fall. Control of perennial grasses may be improved by cultivation prior to treatment.

Residual Activity: May be up to 2 years. Residues are likely to be higher on heavier soil types if higher rates and repeated applications are used.

Unique Characteristics: Moisture is necessary to activate the chemical within 2 weeks after application. Do not apply on soils with less than 1% organic matter, nor on eroded soil areas. Use lower rates on soils with 1%–2% organic matter. Do not apply on weak or diseased strawberry plants.

THIFENSULFURON-METHYL

Trade Name: PINNACLE.

Chemical Family: Sulfonyl urea.

Crop and/or Non-Crop Registrations: Soybeans, tomatoes. Sensitive Weeds: Redroot pigweed, lamb's-quarters, velvetleaf, lady's-thumb and wild mustard.

Uptake and Translocation: Following foliar application, the herbicide is rapidly absorbed and translocated in both the xylem and phloem to growing points of sensitive weeds.

Basis of Selectivity: Inhibition of acetolactase synthase (ALS) enzyme in susceptible plants that leads to a rapid cessation of cell division and plant growth. Tolerant species rapidly metabolize the herbicide into non-phytotoxic metabolites.

Application Method: Postemergence.

Residual Activity: Rapid soil microbial degradation. Half-life of 5 days at 25°C soil temperatures.

Unique Characteristics: Labelled species can be controlled up to 10 cm in height. Redroot pigweed is very sensitive. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on the growing conditions. Velvetleaf control is greatly enhanced by the inclusion of ammonium containing fertilizer (such as a UAN solution).

THIFENSULFURON-METHYL/ TRIBENURON-METHYL

Trade Name: REFINE EXTRA.

Chemical Family: Sulfonyl urea.

Crop and/or Non-Crop Registrations: Wheat (spring, winter, durum), barley, oats not underseeded to legumes or grasses. Refine Extra can be applied to winter wheat in the fall or the spring.

Sensitive Weeds: Lamb's-quarters, annual smartweed (green smartweed, lady's-thumb), chickweed, hemp-nettle, wild buckwheat, cow cockle, stinkweed, Canada thistle, sow-thistle, round-leaved mallow.

Uptake and Translocation: Following foliar application, is rapidly absorbed and translocated in both xylem and phloem.

Basis of Selectivity: Inhibition of acetolactate synthase in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert to non-phytotoxic metabolites.

Application Method: Postemergence.

Residual Activity: Rapid soil microbial degradation.

Unique Characteristics: A non-ionic surfactant must be added. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on growing conditions. Tank-mixes with MCPA and 2,4-D for control of ragweed and mustards.

TOPRAMEZONE

Trade Name: IMPACT.

Chemical Family: Pyrazolone.

Crop and/or Non-Crop Registrations: Field corn.

Sensitive Weeds: annual broadleaf and grassy weeds, including triazine and group 2 resistant biotypes.

Basis of Selectivity: Inhibits the HPPD enzyme found in photosynthetic cells of susceptible species. Symptoms on susceptible plants are bleaching followed by necrosis. Tolerant species rapidly metabolize topramezone.

Application Methods: Postemergence in field corn between the 1- to 8-leaf stage for broadleaf weeds and 1- to 4-leaf stage of grassy weeds.

Residual Activity: Degradation primarily by soil microbial action. Topramezone provides soil residual activity against broadleaf weeds.

Unique Characteristics: The activity of topramezone is significantly enhanced by atrazine. A tank mix of Topramezone with atrazine and dimethenamid provides a one-pass, postemergence weed control program with residual activity against grass and broadleaf weeds.

TRALKOXYDIM

Trade Name: ACHIEVE LIQUID.

Chemical Family: Cyclohexanedione.

Crop and/or Non-Crop Registrations: Spring wheat, spring barley, crested wheatgrass, creeping red fescue, meadow and smooth brome grass, northern wheatgrass, slender wheatgrass and western wheatgrass.

Sensitive Weeds: Wild oats.

Uptake and Translocation: Uptake through the leaves, translocated to growing points of roots, shoots and leaves.

Basis of Selectivity: Metabolized in tolerant species.

Application Methods: Postemergence to actively growing wild oats at 1- to 5-leaf stage. Rainfast in 1 hour.

Residual Activity: None.

Unique Characteristics: Safe on all varieties of spring wheat and barley. May be applied to cereal crops underseeded to legumes such as clover, alfalfa, sain-

foil or bird's-foot trefoil. Do not feed or graze forage in year of treatment.

TRICLOPYR

Trade Name: GARLON 4, RELEASE.

Chemical Family: Pyridine.

Non-Crop Registrations: GARLON 4 – Site preparation for lowbush blueberry, and the control of unwanted woody plants and annual and perennial broadleaf weeds in non-crop areas including rights-of-way, electrical power lines, communication lines, pipelines, roadsides and manufacturing and storage sites. RELEASE silvicultural herbicide is recommended for the control of undesirable woody plants and annual and perennial broadleaf weeds in woodland management.

Sensitive Weeds: Woody plant species controlled are: alder, ash, aspen, basswood, beech, birch, blackberry, raspberry, buckthorn, cottonwood, dogwood, elderberry, hawthorn, hickory, hop-hornbeam, locust, maples, mulberry, poison-oak, poplar, sumac, willow, honey locust, choke cherry, elm, red maple, oaks and pines. Annual and broadleaf weeds controlled are: burdock, chicory, curled dock, dandelion, field bindweed, lamb's-quarters, ragweed, smartweed, smooth bedstraw, vetch and wild lettuce.

Uptake and Translocation: Triclopyr is absorbed by both plant leaves and roots. It is readily translocated through plants. It tends to accumulate in meristematic tissues and is not readily metabolized in susceptible plants.

Basis of Selectivity: Tolerant species such as grasses rapidly metabolize triclopyr.

Application Methods: For deciduous and certain conifer species use as a foliage spray when brush species are actively growing. Apply either broadcast using a fixed nozzle (constant volume per ha) or selectively using a spray gun (variable volume per ha). As spray gun applications use a dilute spray mix, this type of application must thoroughly wet the foliage, stem and root collar. Brush should be treated after foliage is well developed and actively growing. For conifer release in woodland sites, apply in late summer after

conifers have hardened off and deciduous trees are in full leaf but prior to autumn coloration. Woody plants may also be controlled by using basal bark, dormant stem and cut-surface treatments.

Residual Activity: Half-life in soil is approximately 30 days under conditions that are favourable for microbial decomposition.

Unique Characteristics: Apply only when there is little or no hazard from spray drift. Small quantities of spray drift may injure susceptible broadleaf plants.

TRIFLURALIN

Trade Names: BONANZA 400, RIVAL, TREFLAN EC.

Chemical Family: Dinitroaniline.

Crop and/or Non-Crop Registrations: Soybeans, black, kidney, lima, nap and white beans, faba beans, snap beans, lima beans, black beans, canola (rapeseed), sunflowers, turnips, peas (field and canning), direct-seeded alfalfa; transplants of tomatoes, peppers, Brussels sprouts, broccoli, cabbage and cauliflower; carrots, crambe, direct-seeded cabbage and cauliflower, annual flowers, woody ornamental plantings and field-grown nursery stock, perennials, established shelterbelts, strawberries.

Sensitive Weeds: Effective on most annual grasses, and will provide good control of pigweed and lamb's-quarters, including the triazine-tolerant biotypes of these weeds.

Uptake and Translocation: No significant absorption or translocation of trifluralin in crops grown in soil treated with trifluralin. Susceptible weeds are controlled as they germinate. Established weeds are not controlled.

Basis of Selectivity: Physiological growth processes associated with seed germination.

Application Methods: Preplant incorporated. Apply in 100–300 L of water/ha. Use lower rate of the chemical on sandy soils and increased rate for loam-to-clay soils. Do not use on highly organic soils (muck, peat or black sands above 15% organic matter). Incorporate twice in cross directions using a tandem disc (7–10 km/hr) or tine cultivator (10–13 km/hr) set to

work 8–10 cm deep. The first incorporation should be done as soon as possible after application, but may be delayed 8–24 hours, depending on label directions. The second incorporation is recommended anytime before planting. Activated upon incorporation; rainfall is not required.

Residual Activity: Recommended application rates provide season-long weed control. Succeeding crops, even fall-seeded grain crops planted in soil that received trifluralin the preceding spring, will not be injured under normal conditions.

Unique Characteristics: Strongly adsorbed to soil particles and shows negligible leaching. Organic matter and clay content influence application rate. Does not control ragweed, annual nightshades or mustards; lady's-thumb may escape.

TRIFLUSULFURON-METHYL

Trade Name: UPBEET.

Chemical Family: Sulfonylurea.

Crop and/or Non Crop Registrations: Sugar beets. With BETAMIX on sugar beets.

Sensitive Weeds: Redroot and green pigweed, velvetleaf.

Uptake And Translocation: Following foliar application, the herbicide is rapidly absorbed and translocated in both the xylem and phloem to growing points of sensitive weeds.

Basis of Selectivity: Inhibition of acetolactase synthase (ALS) enzyme in susceptible plants that leads to a

rapid cessation of cell division and plant growth. Tolerant species rapidly metabolize the herbicide into non-phytotoxic metabolites.

Application Methods: Postemergence.

Residual Activity: None.

Unique Characteristics: Must be applied with an approved adjuvant system including 0.2% v/v non-ionic surfactant. Addition of 28% urea ammonium nitrate (U.A.N.) at 2 L/ha will improve weed control. Plant death of target weeds may take from 1–3 weeks for visual symptoms to develop. Symptoms develop more quickly under favourable growing conditions.

TABLE 4-5. HERBICIDE GROUPINGS FOR ONTARIO

Gr ¹	Site of Action	Single Modes of Action (alphabetic order)	Confirmed herbicide resistant weeds in Ontario
1	Inhibitors of acetyl CoA carboxylase (ACCase)	Acclaim Super, Achieve, Assure II, Excel Super, Poast, Puma ¹²⁰ Super, Select, Ultra, Venture	Currently none confirmed.
2	Inhibitors of acetolactate synthase (ALS) and also called acetohydroxyacid synthase (AHAS)	Accent, Arsenal, Classic, Elim EP, FirstRate, Muster, Option 2.25 OD, Pinnacle, Prism, Pursuit, Refine Extra, Telar, Ultim, Upbeet	Cocklebur, common ragweed, eastern black nightshade, giant foxtail, green foxtail, green pigweed, lamb's-quarters, redroot pigweed, waterhemp.
3	Microtubule assembly inhibitors	Bonanza, Dacthal W-75, Dimension, Prowl, Rival, Treflan	Currently none confirmed.
4	Synthetic auxins	2,4-D, Banvel II, Caliber, Cobutox, Compitox, Covitox Plus, Desormone, Diphenoprop, Dycleer, Dyvel, Embutox, Estaprop Plus, Garlon, IPCO Dichlorprop-D, IPCO Premium 2-Way XP Turf Herbicide, Killex, Lontrel, MCPA, Mecoprop, Mecocrop 2,4-D, Meco-D, Par III, IPCO Premium 3-Way XP Turf Herbicide, Release, Sword, Target, Topside, Tordon 101, Turf-Rite 2+2, Turboprop, Vanquish	Wild carrot.
5	Inhibitors of photosynthesis at photosystem II, Site A	Aatrex Liquid 480, Atrazine, Gesagard, Hyvar X, Princep, Promone, Pyramin FL, Sencor, Simadex, Simazine, Sinbar, Spin-Aid, Velpar	Barnyard grass, common groundsel, common ragweed, goosefoot, redroot pigweed, waterhemp, wild mustard, witch grass, yellow foxtail.
6	Inhibitors of photosynthesis at photosystem II, Site B	Basagran, Basagran Forté, Koril, Pardner	Green pigweed.
7	Inhibitors of photosynthesis at photosystem II, Site B (alternate binding site)	Diurex 80W, Herbec, Karmex, Lorox	Green pigweed, smooth pigweed.
8	Conjugation of acetyl co-enzyme A	Betasan, Eradicane, Eptam, Ro-Neet	Currently none confirmed.
9	Inhibitors of 5-enolpyruvylshikimate-3-phosphate synthase (EPSP)	Clear-It, Credit, Credit Plus, Expedite Grass & Weed, EZject, Factor, Factor 540 glyphosate, Glyfos, Roundup Ultra II, Roundup Weathermax, Sharpshooter, Sharpshooter Plus, Touchdown iQ, Touchdown Total, Vantage, Vantage Plus, Vantage Plus Max, Vision	Currently none confirmed.
10	Inhibitors of glutamine synthetase	Ignite, Liberty	Currently none confirmed.
11	Inhibitors of carotenoid biosynthesis	Amitrol	Currently none confirmed.
13	Diterpene synthesis inhibitor	Command 360	Currently none confirmed.
14	Inhibitors of protoporphyrinogen oxidase (Protox)	Aim EC, Blazer, Goal, Reflex, Ronstar	Currently none confirmed.
15	Conjugation of acetyl co-enzyme A	Devrinol, Dual Magnum, Dual II Magnum, Frontier	Currently none confirmed.
19	Inhibitors of auxin transport system	Alanap	Currently none confirmed.
20	Inhibits cell wall synthesis, Site A	Casoron	Currently none confirmed.
22	Photo system I – electron diverters	Gramoxone, Reglone, Reward, Weed & Grass Killer	Canada fleabane, field peppergrass.

TABLE 4-5. HERBICIDE GROUPINGS FOR ONTARIO (CONT'D)

Gr ¹	Site of Action	Single Modes of Action (alphabetic order)	Confirmed herbicide resistant weeds in Ontario
23	Inhibitors of mitosis	CIPC	Currently none confirmed.
27	Inhibitors of p-hydroxyphenyl pyruvate dioxygenase (HPPD)	Callisto, Converge Pro, Impact, Infinity	Currently none confirmed.

HERBICIDE GROUPINGS FOR PRE-MIX AND "CO-PACK" PRODUCTS

¹ Herbicide groupings for Ontario follow the Weed Science Society of America's nationally accepted grouping. Groups 12, 13, 16, 17, 18, 21, 24, 25 and 26 are not available in Ontario.² Products with two or more sites of action are followed by the group numbers involved.³ Indicates herbicides sold as a co-pack under this trade name.

TABLE 4-6. INTERVAL BEFORE RAINFALL (POSTEMERGENCE)

Rainfall shortly after application of a postemergence herbicide may reduce the weed control. This effect varies with the product, the formulation, the interval of time and the drying conditions between application and rainfall, as well as on the amount, intensity and duration of rainfall. The following information is based on label information and additional detail supplied by the chemical industry. For further information, contact the manufacturer. In the case of a tank-mix, use the longest time interval of the products being considered.

0 TO 15 MINUTES	1 HOUR	2 HOURS	3 HOURS	4 HOURS	4 HOURS (CONT'D)	6 HOURS

5. NOTES ON ADJUVANTS

INTRODUCTION

An adjuvant is any substance added to a spray solution to modify and enhance the effectiveness of the herbicide.

Adjuvants are an important part of the spray solution and if not used will negatively affect the degree of weed control obtained. Some products have adjuvants formulated into the product while other products require that the user add the adjuvant. The selection of adjuvants is key to getting the right balance between maximizing weed control and minimizing crop injury. In some cases the rate of adjuvant varies depending on conditions of weather, crop stage, weed species, water quality, etc. Some herbicide labels recommend particular adjuvant products and some recommend particular types of adjuvants. Always use adjuvants as directed on the product label.

Most adjuvant recommendations in this guide are listed as the amount (in litres) added to 1,000 L (1,000 L) of spray solution. If you wish to convert to % volume/volume (v/v) use the following conversion:

$$10 \text{ L}/1,000 \text{ L} = 1 \% \text{ v/v}$$

There are 2 broad categories of adjuvants:

- activators and spray modifiers, and
- utility modifiers.

Activators and Spray Modifiers

- **Surfactants** (also known as “surface active agents”) are the largest class of adjuvants. Surfactants can be non-ionic, anionic, cationic or amphiprotic. Most

surfactants are non-ionic (NIS); that is they do not ionize. A NIS is used to enhance herbicide penetration into a waxy cuticle. Wetting agents and detergents are primarily anionic and when ionized in solution, the water soluble portion is negatively charged. Cationic surfactants exhibit a net positive charge in solution. Amphiprotic surfactants can be either anionic or cationic. Cationic and amphiprotic are not widely used in agricultural chemicals.

- **Oils** solubilize the waxy cuticle layer on a weed to increase spray penetration through the leaf cuticle. Oils are refined mineral oils (petroleum based) or seed oils. Seed oils are categorized as triglycerides, methylated seed oils (MSO) or crop oil concentrates (COC). Crop oil concentrates are a combination of seed oil and surfactants.
- **Spreader**s are wetting agents that reduce the surface tension to create better contact between the spray solution and the treated surface (leaf, etc.). A sticker increases the herbicide adhesion to the leaf surface.

Utility Modifiers

- **Compatibility** agents improve mixing, especially when using a liquid fertilizer carrier.
- **Drift control** agents increase the droplet size to reduce drift.
- **Anti-foaming** agents are used to reduce foaming in the spray tank.
- **Foaming** agents are used with specialized equipment to produce and apply foam.

- **Buffering** agents can be used to enhance solubility or adjust pH.
- **Dyes** in some instances are used to enhance visibility of spray foam solutions.

Note

Read the following notes together with the recommendations given later in this publication. Additional information on use, toxicity and safety precautions is given here. With a few exceptions the adjuvants are listed under their trade or product name. See Table 5-1, *Adjuvants Used in Ontario*, on page 72 for a summary of adjuvants listed in this publication.

Complete information on each adjuvant is available on the product label which is located on the product container. The federal Pest Management Regulatory Agency also lists pesticide labels on their website at: www.pmr-arla.gc.ca.

Many pesticide manufacturers also list product labels and/or Material Safety Data Sheets (MSDS) on their websites that are listed on the last page of this publication.

AGRAL 90

Type of Adjuvant: Non-ionic surfactant.

Chemical Composition: Nonylphenoxy polyethoxyethanol 90%.

Registered Uses: For use with REGLONE, glyphosate, PURSUIT, ACCENT, ULTIM and other products as labelled. Also used for washing sprayer tanks and equipment.

Benefit: Improves chemical effectiveness.

Mode of Action: It is a wetting and spreading agent that improves coverage of spray mixes.

Mixing: Use 250–1,000 mL/1,000 L of water as specified on label. Will mix with all types of water. Add AGRAL 90 to the spray mixture and agitate thoroughly.

Unique Characteristics: Do not exceed the recommended rates of AGRAL 90 as too much wetting agent can lead to loss of spray due to excessive run-off.

AG-SURF

Type of Adjuvant: Non-ionic surfactant.

Chemical Composition: Nonylphenoxy polyethoxyethanol 92%.

Registered Uses: For use with glyphosate, PURSUIT and other products as labelled.

Benefit: Improves chemical effectiveness.

Mode of Action: It is a wetting and spreading agent that improves coverage of spray mixtures.

Mixing: For use with ROUNDUP: when applying the 2.5 L/ha of water, add AG-SURF at 0.5% (0.50 L/100 L water) to maintain adequate surfactant concentration. For use with ROUNDUP to control annual grasses and broadleaf weeds for minimum or zero-till: use 350 mL/ha plus ROUNDUP at 1.1 L/ha in 50–100 L/ha of clean water.

Unique Characteristics: Do not exceed recommended rates of AG-SURF, as too much may reduce the effectiveness of the herbicide due to excessive run-off. Consult product label for full directions.

ALLIANCE 400

Type of Adjuvant: Compatibility Agent.

Chemical Composition: Aliphatic phosphate ester, isopropanol and glycol ethers 69%.

Benefit: Emulsifies and disperses liquid fertilizers and emulsifiable pesticides in solution to produce uniform tank-mixes.

Mixing: Mix 60–375 mL of Alliance/100 L of solution depending on fertilizer and number of pesticides. Add alliance to the fertilizer solution before the pesticide.

AMIGO

Type of Adjuvant: Surfactant.

Chemical Composition: 30% phosphate ester surfactant.

Registered Uses: For use with SELECT and SELECT tank-mixes.

Benefit: Improves chemical effectiveness under varying environmental conditions.

Mode of Action: Improves spreading of spray droplets on the leaf surface and increases contact area. Enhances penetration of herbicide through the leaf cuticle layer.

Mixing: Half-fill spray tank with water and start agitation. Add the correct amount of herbicide, agitate and then add the correct amount of AMIGO with the remaining water. Continue to agitate.

AQUASOFT

Type of Adjuvant: Water conditioning agent.

Chemical Composition: Proprietary blend of hydroxy carboxylic acid, phosphoric acids and ammonium sulfate polyacrylic acid 63%.

Benefit: Eliminates hard water antagonism as well as formulation instability due to high pH.

Mode of Action: Conditions water by sequestering and chelating hard water ions and reducing the pH.

Mixing: 100–750 mL/100 L of spray solution, depending on water hardness. Always check compatibility with a jar test.

AQUA-STABLE

Type of Adjuvant: Buffering agent.

Chemical Composition: Aliphatic polycarboxylate & calcium chloride 28%.

Benefit: Reduces pesticide breakdown from alkaline spray solutions.

Mode of Action: Acidifies and buffers spray solution.

Mixing: 60–250 mL/100 L of spray solution, depending on the PPM alkalinity.

ASSIST OIL CONCENTRATE

Type of Adjuvant: Mineral oil/surfactant (non-herbicidal).

Chemical Composition: 83% paraffin base mineral oil plus 17% surfactant blend.

Registered Uses: ASSIST OIL CONCENTRATE is registered for use with BASAGRAN, IMPACT, LADDOK and atrazine.

Benefit: Using ASSIST results in improved postemergence activity and a greater degree of consistency under varying environmental conditions. ASSIST also aids in providing a faster weed kill.

Mode of Action: Reduces the evaporation of spray droplets on the leaf surface leading to a longer period for penetration. Improves penetration through the leaf cuticle layer. ASSIST also aids in spreading a spray droplet on the leaf surface so that it covers a greater surface area.

Mixing: Half-fill the spray tank with water and begin agitation. Add the desired amount of herbicide and continue filling. Add ASSIST last. After filling, continue agitation. Agitate thoroughly after any stoppage in spraying.

Unique Characteristics: May cause increased temporary topical burn to crop plants under hot, humid weather conditions.

BREAKER

Type of Adjuvant: Antifoamer/Defoamer.

Registered Uses: To reduce foaming when preparing herbicide spray mixes.

Benefit: Small quantities of BREAKER added before adding herbicides will prevent foam from forming.

Mixing: Add 7 mL/500 L of spray mix.

Unique Characteristics: Can be added after foam has formed but more time will be required to eliminate the foam.

BUFFERING AGENTS

See AQUA-STABLE.

CHOICE

Type of Adjuvant: Water conditioning agent.

Chemical Composition: Blend of polyacrylic, hydroxy carboxylic, propionic acids, phosphate ester and ammonium sulfate.

Benefit: Eliminates “hard water antagonism” and instability due to high pH.

Mode of Action: Conditions water by sequestering or chelating hard water ions and by the reduction in pH.

Mixing: 2.5–7.5 L/1,000 mL water.

COMPANION

Type of Adjuvant: Non-ionic surfactant.

Chemical Composition: Octylphenoxy-polyethoxy-(9)-ethanol 70%.

Registered Uses: glyphosate, TELAR, MUSTER and other products as labelled.

Benefit: Improves chemical effectiveness.

Mode of Action: It is a wetting and spreading agent that improves coverage of spray mixes.

Mixing: With glyphosate, for the control of annual grasses and broadleaf weeds, add 450 mL of COMPANION in 50–100 L of water/ha. With TELAR, add 100 mL of COMPANION to 100 L of water for the control of broadleaf weeds. Use constant agitation.

Unique Characteristics: Do not exceed the recommended rates of COMPANION as too much may reduce the effectiveness of the herbicide due to excessive run-off.

COMPATABILITY AGENTS

See ALLIANCE 400, UNITE.

DEFOAMERS/ANTIFOAMERS

See BREAKER, FIGHTER F, FLAT-OUT, HALT, VALID.

DRIFT-CONTROL AGENTS

See ON-TARGET, VALID.

DYES

See IN-SIGHT.

FIGHTER F

Type of Adjuvant: Antifoamer Defoamer.

Chemical Composition: Dimethyl-polysiloxane 10%.

Registered Uses: To control foam in water, oil, fertilizer and pesticide spray mixtures.

Benefit: Controls foam when mixing sprays, eliminates material waste, provides more accurate metering of agricultural sprays, and eliminates foam overflow at fill site.

Mixing: To control foam when mixing spray solution, add defoamer either just before or during addition of any other spray adjuvant. To cut existing foam, add defoamer to tank and recirculate solution until foam dissipates.

FLAT-OUT

Type of Adjuvant: Defoamer.

Chemical Composition: Dimethylpolysiloxane 18% Silicone base neutral.

Registered Uses: To control foam formation or existing foam, use as premix or add while spray tank is being filled.

Benefit: The reduction of foam allows for faster tank fill, ensures fill volumes are correct and reduces the possibility of chemical overflow, therefore more accurate application. It also makes the cleaning process easier.

Mixing: Add 5–10 mL/100 L of solution. Adjust the amount required according to individual conditions. May be used before mixing to prevent foam, or after to cut foam. May be used with any herbicide unless contra-indicated on the label.

FOAM MARKERS

See TRAMLINE, TREKKER TRAX.

HALT

Type of Adjuvant: Defoamer.

Chemical Composition: Silicone base, neutral.

Registered Uses: To reduce foaming when preparing herbicide spray mixes.

Benefit: The reduction of foaming allows faster tank fill-ups, ensures correct fill volumes, reduces the possibility of chemical overflow and gives more accurate herbicide application.

Mixing: Add 7 mL/500 L of spray mix. May be added to spray tank during filling to prevent foaming, or after to cut foam.

Unique Characteristics: May be used with any herbicide unless otherwise stated on the product label.

HASTEN

Type of Adjuvant: Non-ionic esterified vegetable oil.

Chemical Composition: Methyl and ethyl oleate 77.4%.

Registered Uses: For use with OPTION 35DF.

Benefit: Improves the post emergence activity of OPTION 35DF.

Mixing: Add at a rate of 1.75 L/ha. Ensure that OPTION 35DF has fully dissolved before adding HASTEN. Agitate thoroughly.

IN-SIGHT

Type of Adjuvant: Foam Marker Dye.

Active Ingredients: Dye, Surfactants, and Coupling Agents.

Uses: As a colour dye marker for foam markers and as a dye marking agent for turf applications.

Benefit: Allows foam marking systems to show up under poor visibility conditions of low light, heavy trash, no-till, snow or fog.

Mixing: Use 15–30 mL/100 L of spray solution.

KORNOIL

Type of Adjuvant: Mineral oil (non-herbicidal).

Chemical Composition: 98.5% mineral oil, 1.5% emulsifier.

Registered Uses: (Crop/herbicide): Corn/atrazine.

Benefit: Improved postemergence activity of atrazine.

Mode of Action: Partially dissolves waxy cuticle of weeds allowing atrazine to penetrate more readily.

Mixing: Fill spray tank with water allowing space for subsequent addition of atrazine and oil; engage agitation and pour in premixed slurry of atrazine in water; add KORNOIL last. Avoid excessive agitation of the spray mix as this may cause coagulation or buttering out.

Unique Characteristics: To prevent a build-up of oil in the sprayer, empty the tank as completely as possible before refilling. Some injury may occur if the crop is stressed (cold weather or hot, dry weather).

KORNOIL CONCENTRATE

Type of Adjuvant: Mineral oil/surfactant (non-herbicidal).

Chemical Composition: Paraffin-base mineral oil 85%, surfactant blend 15%.

Registered Uses: To be blended with atrazine/water mixtures and applied postemergence in corn.

Benefit: Improved postemergence activity of atrazine.

Mode of Action: Partially dissolves waxy cuticle of weeds allowing atrazine to penetrate more readily. Also reduces evaporation and aids in spreading of spray droplets on the leaf surface leading to a longer period for penetration.

Mixing: Avoid violent agitation; partially fill sprayer, add atrazine slurry, add KORNOIL CONCENTRATE last.

Unique Characteristics: Some injury may occur with cold, rainy weather.

LI700

Type of Adjuvant: Non-ionic surfactant and pH Adjuster/Acidifier.

Chemical Composition: Phosphatidyletholine, methylacetic acid and alkyl polyoxyethylene ether 80%.

Registered Uses: As a penetrating surfactant; as a pH adjuster/acidifier; for use with glyphosate products. LI700 neutralizes or slightly acidifies the spray solution and prevents the breakdown hydrolysis of pH sensitive products in the spray tank. Add LI700 before adding the pesticide.

Benefit: Improves chemical effectiveness.

Mixing: As a penetrating surfactant: Use 5 L of /1,000 L spray mixture or 500 mL of /100 L spray mixture. As a pH adjuster/acidifier: Highly alkaline water, (pH 8 or higher). Use: 625 mL–1.25L /1,000 L water mixture.

MERGE

Type of Adjuvant: Surfactant/solvent.

Chemical Composition: 50% surfactant blend plus 50% solvent (petroleum hydrocarbons).

Registered Uses: For use with POAST ULTRA.

Benefit: Improves chemical effectiveness and provides a greater degree of consistency under varying environmental conditions.

Mode of Action: Improves spreading of spray droplets on the leaf surface and increases contact surface area. Improves penetration of herbicide through the leaf cuticle layer. Acts as a protectant against photodegradation of POAST ULTRA by UV light.

Mixing: Half-fill spray tank with water, start agitation. Add required amount of herbicide and continue agitation. Add MERGE, along with remaining water, last to the tank. Agitate thoroughly after any stoppage in spraying.

Unique Characteristics: May cause temporary topical burn to crop plants under hot, humid weather conditions.

MINERAL OIL/SURFACTANT (NON-HERBICIDAL)

See ASSIST OIL CONCENTRATE, KORNOIL, KORNOIL CONCENTRATE, NA OIL CONCENTRATE.

OIL

See MINERAL OIL.

ON TARGET

Type of Adjuvant: Deposition Aid / Drift Control agent.

Chemical Composition: Polyvinyl Polymer (Polyacrylamide) 30%.

Registered Uses: For use with most water soluble and wettable powder pesticides and desiccants, including glyphosate, when applied by aerial application or standard ground equipment.

Benefit: Deposition improvement and drift retardation in spraying operations, to potentially reduce injury to adjacent crops or plants.

Mode of Action: When tank-mixed with a pesticide ON TARGET reduces drift by materially reducing fines resulting from shear.

Mixing: Fill mix tank with water, pesticide and other additives and begin to agitate. Select correct dosage, shake bottle well before using, either inject ON TARGET liquid into the suction side of the feeder or recirculating pump or slowly add ON TARGET liquid to the rapidly agitating tank-mix in the area of highest turbulence by pouring a very thin stream. This obtains the best dispersion of the polymer throughout the pesticide solution. Allow mixing to continue for at least 2 minutes before spraying.

SIDEKICK

Type of Adjuvant: Non-ionic liquid spreader/activator.

Chemical Composition: Alkylaryl polyoxyethylene glycols, free fatty acids & isopropyl alcohol.

Registered Uses: For use with PURSUIT, ACCENT, ASSURE II and other products as labelled.

Benefit: Improves spray chemical effectiveness.

Mode of Action: It is a wetting and spreading agent that improves coverage of spray mixtures.

Mixing: Make sure the spray tank is thoroughly cleaned before mixing. Fill the spray tank half full with water. Add the required amount of herbicide as directed by its label with the agitator running. Ensure that the herbicide is completely mixed before proceeding to the next step. Slowly add the SIDEKICK, agitating during the entire process. Continue to agitate while filling the tank with water and agitate before and during each application to insure a uniform spray.

Unique Characteristics: Do not exceed recommended rates of SIDEKICK, as too much may reduce the effectiveness of the herbicide due to excessive runoff. Consult product label for full directions.

SUPER SPREADER

Type of Adjuvant: Non-ionic spreader sticker surfactant.

Chemical Composition: Octyl phenoxy poly ethoxy ethanol 50%.

Registered Uses: For use with ACCENT, atrazine, BASAGRAN, MUSTER, PINNACLE, TELAR, PRISM, PYRAMIN FL., REFINE EXTRA, REFLEX, ULTIM and other products as labelled.

Benefit: Improves postemergence control of weeds that have reached their upper limit in size for susceptibility.

Mode of Action: Causes the spray mix to form a continuous film on leaf surfaces; also makes herbicide more rainfast.

Mixing: Use 1–2.5 L/ha. Half-fill tank with water; add herbicide with continuous agitation; complete filling of tank with water; add SUPER SPREADER STICKER with continuous agitation.

Unique Characteristics: Higher rates are required with hard water.

SURE-MIX

Type of Adjuvant: Paraffinic petroleum oil/surfactant (non-herbicidal).

Chemical Composition: 60% Paraffinic petroleum oil plus 35.6% surfactant blend.

Registered Uses: SURE-MIX is registered for use with ASSURE II.

Benefit: The use of SURE-MIX results in improved activity of ASSURE II and a greater degree of consistency under varying environmental conditions.

Mode of Action: Reduces the evaporation of spray droplets from the leaf surface and decreases the surface tension of spray droplets thus improving penetration through the cuticle of leaf surfaces.

Mixing: Add the required amount of water to the spray tank with agitator running. Add ASSURE II and after well mixed add 5 L of SURE-MIX for each 1,000 L of spray solution.

Unique characteristics: May cause some minor leaf speckling under hot and humid weather conditions.

SURFACTANTS

See AGRAL 90, AG-SURE, COMPANION, LI700, MERGE, SIDEKICK, SUPER SPREADER, SYLGARD 309, XA OIL CONCENTRATE.

SYLGARD 309

Type of Adjuvant: Non-ionic surfactant.

Chemical Composition: Siloxylated polyether 76%.

Registered Uses: For use with PURSUIT on soybeans for annual broadleaf and grass control; and glyphosate for quack grass control and annual broadleaf weed control in summer fallow; and with TORDON 101 for faster burndown of coniferous species on right-of-ways.

Benefits: Improves chemical effectiveness by increasing the amount and rate of uptake of water-soluble herbicides.

Mixing: Use 2.5 L/1,000 L of spray solution for most applications; add this amount last to the spray tank after the herbicide has been thoroughly mixed. Apply the spray solution as soon as possible after mixing.

Unique Characteristics: This organosilicone formulation has lowest surface tension of any adjuvant available.

TRAMLINE

Type of Adjuvant: Foam Marker.

Chemical Composition: Nonionic and anionic surfactants, 30%.

Benefit: Improves placement of herbicides by indicating area of field sprayed, preventing overlaps and misses.

Mixing: Depending on water hardness and mineral content mix 0.65–1 L/100 L of water.

TREKKER TRAX

Type of Adjuvant: Foam marker.

Chemical Composition: 24% alcohols and 30% mixed anionic and nonionic surfactants.

Benefit: Improves placement of herbicides by indicating area of field sprayed.

Mixing: Depending on water hardness, use 1–2 L/100–150 L water.

TURBOCHARGE

Type of Adjuvant: Surfactant/solvent.

Chemical Composition: 39.5% surfactant blend plus 50% solvent (mineral oil).

Registered Uses: For use with ACHIEVE 40 DG herbicide.

Benefit: Improves chemical effectiveness and provides a greater degree of consistency under varying environmental conditions.

Mode of Action: Improves spreading of spray droplets on the leaf surface and increases contact surface area. Improves penetration of herbicide through the leaf cuticle layer.

Mixing: Half-fill spray tank with water, start agitation. Add required amount of herbicide and continue agitation. Add TURBOCHARGE along with remaining water last to the tank. Agitate thoroughly after any stoppage in spraying. Use at a rate of 0.5 L TURBOCHARGE/100 L of spray mixture. If tank-mixing with other herbicides, always add the TURBOCHARGE last.

UNITE

Type of Adjuvant: Compatibility Agent.

Chemical Composition: 83.7% acid polyglycols and methyl alcohol.

Benefit: Improves the compatibility of liquid fertilizer-pesticide mixtures.

Mixing: 240–1,420 mL/378.5 L. Perform a test of physical compatibility of various pesticides and fertilizer mixtures in a small quantity to determine the exact amount of UNITE and the mixing method to be used.

VALID

Type of Adjuvant: Deposition and drift reduction agent, antifoam-defoamer.

Chemical Composition: Lecithin, emulsifiers, glycols and dimethylpolysiloxane defoamer.

Benefit: Small quantities of VALID added before adding pesticides will prevent foam from forming. Adding VALID to the spray tank will also reduce the production of fine spray droplets that may drift.

Mixing: Mix 125 mL per 100 L of spray mixture.

WATER CONDITIONING AGENTS

See AQUASOFT, CHOICE.

WATER-SOLUBLE DYES

See AQUASHADE.

XA OIL CONCENTRATE

Type of Adjuvant: Mineral oil/surfactant (non-herbicidal).

Chemical Composition: 83% paraffin-base mineral oil plus 17% surfactant blend.

Registered Uses: atrazine, ASSURE, BASAGRAN, LADDOCK and other products as labelled.

Benefit: May result in improved postemergence activity.

Mode of Action: Reduces the evaporation of spray droplets from the leaf surface and decreases the surface tension of spray droplets, thus improving the penetration through the cuticle of leaf surfaces.

Unique Characteristics: Caution with new corn varieties. Do not mix with 2,4-D; MCPA; 2,4-DB; MCPB or dicamba.

TABLE 5-1. ADJUVANTS USED IN ONTARIO

Brand and Trade Names*	Type of Adjuvant	Chemical Composition	Guaranteed Active	Ont. Sch.	Winter Storage	Manufacturer/ Agent Code
AGRAL 90	non-ionic surfactant	nonylphenoxy polyethoxyethanol	90%	2	C	NOR
AG-SURF	non-ionic surfactant	nonylphenoxy polyethoxyethanol	92%	2	C	INT

TABLE 6-2. PREPLANT HERBICIDE WEED CONTROL RATINGS

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

--	--	--------------------------	---

Stale Seedbed and Inter-Row Weeding

The stale seedbed technique is useful when the soil can be worked well before planting and weeds are allowed to emerge for several weeks. Apply one of the non-selective postemergent herbicides listed here to kill emerged weeds. Seeding or planting directly into the killed weeds with minimal soil disturbance will allow the crop to establish before the next flush of weed emergence. Follow up with either cultivation, hoeing or postemergent or directed herbicides to control later germinating weeds.

Where registered, some herbicides can be applied after seeding but before crop emergence.

AIM EC (240 g/L) plus AGRAL 90 or AG-SURF or MERGE	37 to 117 mL/ha 2.5 L/1,000 L 2.5 L/1,000 L 1 L/1,000 L	5 to 47 mL/ac 2.5 L/1,000 L 2.5 to 1,000 L 1 L/1,000 L	<ul style="list-style-type: none"> • Apply POST with a HOODED SPRAYER between the rows or between the plastic mulch. • Apply to actively growing weeds up to 10 cm tall. • Apply in a minimum of 100 L/ha (40 L/ac) water. • Apply ONLY once per growing season • AIM EC may cause crop injury if the spray is allowed to come in contact with the green stem, leaves, bloom or fruit. • Pre-Harvest Interval (PHI) ranges from 1 to 15 days depending on the crop. Refer to the product label for a specific crop's PHI. • Refer to product label or <i>Chapter 4, Notes on Herbicides</i>, page 29 for a list of registered crop uses.
carfentrazone-ethyl plus non-ionic surfactant or surfactant solvent	8.9 to 28 g/ha 0.25% v/v 0.1 % v/v		
glyphosate (360 g/L) or glyphosate (480 g/L) or glyphosate (500 g/L) or glyphosate (540 g/L)	0.75 to 3.5 L/ha 0.56 to 2.63 L/ha 0.54 to 2.52 L/ha 0.5 to 2.3 L/ha	0.3 to 1.4 L/ac 0.22 to 1.05 L/ac 0.22 to 1.0 L/ac 0.2 to 0.93 L/ac	<ul style="list-style-type: none"> • Till and fertilize soil in early spring. • Allow weeds to grow, and spray weeds just before seeding crop. • Use low rate for small weeds (8 cm), medium rates for weeds 8–15 cm and higher rate for weeds over 15 cm tall. • Apply recommended herbicides to control new flushes of weeds or use mechanical means of control.
glyphosate*	0.27 to 4.32 kg/ha		
GRAMOXONE (200 g/L) REGLONE (200 g/L)	3 to 5.5 L/ha 3 to 5.5 L/ha	1.2 to 2.2 L/ac 1.2 to 2.2 L/ac	<ul style="list-style-type: none"> • For emerged weeds after the crop seed is sown, but before crop emergence. • For use only in beans (all types), beets, carrots, cole crops, corn, onions, peas, cucumbers, potatoes, soybeans and turnips. • In inter-row weeding, special low pressure equipment is used to apply the herbicide on emerged weeds without contact with leaves of the crop plants. • For small areas, apply 30 mL product in 10 L water per 100 m².
paraquat or diquat	0.6 to 1.1 kg/ha 0.6 to 1.1 kg/ha		
IGNITE (150 g/L)	2.7 to 5 L/ha	1.08 to 2 L/ac	<ul style="list-style-type: none"> • For use only in carrot, lettuce and onion crops. • Apply in a minimum of 110–330 L/ha (44–132 L/ac) of water. • Apply after seeding, but prior to emergence of the crop.
glufosinate ammonium	0.405 to 0.75 kg/ha

Dry, Lima, Snap)

7. BEANS (ADZUKI, DRY, LIMA & SNAP)

NOTE: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavourable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

TABLE 7-1. BEANS (ADZUKI, DRY, LIMA AND SNAP) WEED CONTROL RATINGS

TRADE NAME	CROP REGISTRATIONS											ANNUAL GRASSES								ANNUAL BROADLEAVES										PERENNIALS								Crop Tolerance	
	adzuki beans	black beans	dutch brown	cranberry beans	kidney beans	lima beans	otoe beans	pinto beans	small red Mexican	snap beans	yellow eye	white beans	barnyard grass	crabgrass	fall panicum	foxtail, giant	foxtail, green	foxtail, yellow	witch grass	proso millet	buckwheat, wild	fleabane, Canada	lady's-thumb	lamb's-quarters	mustards	nightshades, annual	pigweeds	ragweed, common	ragweed, giant	velvetleaf	bindweed, field	horsetail	milkweed	nutsedge	quackgrass	sow-thistle	thistle, Canada

Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor.

^a Various formulations available, see Table 4-1, page 29. See label for specific uses and rates.

¹ POAST ULTRA (quackgrass rate – 1.1 L/ha) is not registered for use on snap beans.

^b Use PPI timing for optimum control.

✓Can be used on this crop.

BOLD numbers indicate the weed is listed on the product label for control or suppression.

² Insufficient information available to make a rating.

³ Use the high rate of herbicide for optimum control.

⁴ Use PRE timing for optimum control.

BEANS (ADZUKI, DRY, LIMA AND SNAP)

Dry beans include black, cranberry, Dutch brown, kidney, mung, otebo, pinto, small red Mexican, yellow eye and white bean market classes.

Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.

When developing a weed control program, consider cultivation, rotation and other cultural practices along with herbicide treatments. Any single method of weed control, or the continuous use of the same chemical, can lead to the build up of weeds resistant or tolerant to that control method. Rotating crops and/or other control methods reduce the chance of developing new or unique weed infestations.

High speed (10–20 km/hr), shallow (2.5–3 cm) cultivation with a rotary hoe when beans are in the 1–2 leaf stage helps control small weed seedlings. This technique does not reduce herbicide action and may, in some years, enhance chemical weed control and improve crop safety.

Inter-row cultivation may be needed when weeds escape herbicide treatment; consider weeds 'escapes' when they are 5–7 cm high. Cultivate shallow to prevent exposure of untreated soil and germination of new weed seeds.

Band treatment of chemical over the row reduces costs by one-half to two-thirds, depending on row spacing and width of band. Shallow inter-row cultivation will be required to control weeds between the bands.

Cultivation will give some control of established perennial weeds but may also help to spread them to previously uninfested areas. Machinery sanitation is important when moving from one field to another.

Some chemicals may also be impregnated on dry bulk fertilizer. Check the label for recommended fertilizer ingredients. Please refer to Table 7-1, *Beans (Dry, Lima And Snap) Herbicide Weed Control Ratings*, page 85 to determine which market classes of edible beans are registered for the herbicide treatments listed.

Rates and application techniques vary for trifluralin products. For further information on these and other chemicals refer to label recommendations and also *Notes on Herbicides*, on page 29.

Herbicide Application Timings

- **Preplant (PP)** – Also see Special Methods, *Preplant-Site Preparation Prior To Any Crop*, on page 78 for details of products, rates and remarks.

- **Preplant Incorporated (PPI)** – Unless stated otherwise, two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Pay special attention to machinery cleanliness and/or treating fields with perennial weeds last.

- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see <i>Notes on Herbicides</i> , page 29).
Soil Applied Grass Herbicides			
DUAL II MAGNUM (915 g/L) <i>s-metolachlor/benoxacor</i>	1.15 to 1.75 L/ha 1.05 to 1.6 kg/ha	0.46 to 0.7 L/ac	<ul style="list-style-type: none"> • Apply PPI or PRE on all dry bean (<i>Phaseolus vulgaris</i>) species, except Lima when applied PRE. • Apply PPI to minimize the potential for crop injury. • Do NOT use on adzuki beans. • Do NOT use on muck, peat or high organic matter soils. • Use the low rate on coarse-textured soils low in organic matter. • Requires rainfall for activation. Rotary hoe if no rainfall occurs within 7 days. • Improved control of yellow nutsedge is obtained when DUAL MAGNUM is applied PPI. • Use the higher rate for the control of nightshade.
EPTAM (800 g/L) EPTC	4.25 to 5.5 L/ha 3.4 to 4.4 kg/ha	1.7 to 2.2 L/ac	<ul style="list-style-type: none"> • Apply PPI. Incorporate immediately. • Do NOT use on adzuki, lima, otebo and small red Mexican beans. • If dry weather has preceded the application of EPTC, delay seeding 7–10 days. • Temporary injury can occur in the emerging crop. • Use the high rate for nutsedge control.
FRONTIER (900 g/L) <i>dimethenamid</i>	1.1 to 1.4 L/ha 1 to 1.25 kg/ha	0.44 to 0.56 L/ac	<ul style="list-style-type: none"> • Apply PPI or PRE. • Apply PPI to minimize the potential for crop injury. • Use only on white and kidney beans. • Do NOT use on muck, peat or high organic matter soils. • Use the low rate on coarse-textured soils low in organic matter. • Minimum PPI rate is 1.4 L/ha (0.5 L/ac). • Improved control of yellow nutsedge is obtained when FRONTIER is applied PPI. • Use the higher rate of FRONTIER for the control of nightshade and pigweed. • Requires rainfall for activation. Rotary hoe if no rainfall occurs within 7 days.
TREFLAN EC (480 g/L) or RIVAL (500 g/L) or BONANZA 400 (400g/L) <i>trifluralin</i>	1.25 to 2.4 L/ha 1.2 to 2.3 L/ha 1.5 to 2.75 L/ha 0.6 to 1.155 kg/ha	0.5 to 0.96 L/ac 0.48 to 0.92 L/ac 0.6 to 1.1 L/ac	<ul style="list-style-type: none"> • Apply PPI. Incorporate as soon as possible. Within 24 hours. • Do NOT use on adzuki, brown, cranberry, otebo, pinto, small red Mexican and yellow-eye beans. • Do NOT exceed 1.2 L/ha (0.48 L/ac) of TREFLAN on medium textured soils and 1.7 L/ha (0.68 L/ac) in heavy textured soils for lima beans.

fomesafen plus adjuvant	0.24 kg/ha 0.25% v/v		
Postemergence Tank-Mixes			
BASAGRAN (480 g/L) plus REFLEX (240 g/L) plus ASSIST	1.75 L/ha 0.58 L/ha 2 L/ha	0.7 L/ac 0.23 L/ac 0.8 L/ac	<ul style="list-style-type: none"> • Apply POST when beans are in the 1–2 trifoliate leaf stage. • Use only on white and kidney beans. • Refer to the BASAGRAN label and the REFLEX label for information on specific weed stage and height. • Do NOT apply if rain is expected within 6 hours after application.
bentazon plus fomesafen plus oil concentrate	0.84 kg/ha 0.14 kg/ha 2 L/ha		
EXCEL SUPER (80.5 g/L) plus BASAGRAN (480 g/L) plus ASSIST	0.67 L/ha 1.75 to 2.25 L/ha 2 L/ha	0.27 L/ac 0.7 to 0.9 L/ac 0.8 L/ac	<ul style="list-style-type: none"> • Apply POST when beans are in the unifoliate to 4 trifoliate leaf stage and annual grasses are in the 2–5 leaf stage. • Apply POST to all dry bean (<i>Phaseolus vulgaris</i>) species listed in Table 7-1. • Do NOT use on adzuki beans. • Temporary crop injury may occur under abnormally hot, humid conditions. Reduce the oil concentrate to 1 L/ha (0.4 L/ac) when these conditions occur. Apply when weeds are small and actively growing. • Refer to the BASAGRAN label for information on specific weed stage and height. • If broadleaf and grass weeds are not in the correct leaf stage for a tank-mix application, use a split application at the correct stage for each product. • Do NOT apply if rain is expected within 6 hours after application.
fenoxaprop-p-ethyl plus bentazon plus oil concentrate	0.054 kg/ha 0.84 to 1.08 kg/ha 2 L/ha		
Preharvest			
AIM EC (240 g/L) plus non-ionic surfactant or MERGE	73 to 117 mL/ha 2.5 L/1,000 L 10 L/1,000 L	30 to 47 mL/ac 2.5 L/1,000 L 10 L/1,000 L	<ul style="list-style-type: none"> • Apply to actively growing weeds, up to 10 cm. • Coverage of weed and crop foliage is essential for control. • Preharvest interval (PHI) is 1 day.
carfentrazone-ethyl plus non-ionic surfactant or MERGE	0.0175 to 0.028 kg/ha 0.25% v/v 0.1% V/V		

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see <i>Notes on Herbicides</i> , page 29).
glyphosate (360 g/L) or glyphosate (480 g/L) or glyphosate (500 g/L) or glyphosate (540 g/L)	2.5 L/ha 1.86 L/ha 1.8 L/ha 1.67 L/ha	1 L/ac 0.75 L/ac 0.72 L/ac 0.67 L/ac	<ul style="list-style-type: none"> • Apply Preharvest when the crop is 30% grain moisture or less (yellow to brown pod colour, 80%–90% leaf drop) and at least 7 days prior to harvest. • Do NOT use on snap beans. • Do NOT apply to crops grown for seed. • Do NOT apply by air. • Apply in 50–100 L/ha of water. • Do NOT apply if rain is expected within 6 hours after application.
glyphosate*	0.9 kg/ha		
IGNITE (150 g/L)	2.5 to 3 L/ha	1 to 1.2 L/ac	<ul style="list-style-type: none"> • Apply Preharvest when approximately 50%–75% of the bean pods have naturally changed colour from green to yellow or brown and at least 9 days before harvest. • Do NOT use on snap beans. • Do NOT apply to dry beans grown for seed. • Use the higher rate when the crop canopy is dense and/or there are high populations of weeds present at application. • Apply in a minimum of 110 L/ha (44 L/ac) of water at a pressure of 275 kPa (40 psi). Where crop canopy is dense, or weed growth is heavy, apply 170–220 L/ha (68–88 L/ac) of water. • Do NOT apply by air. • Do NOT apply if rain is expected within 4 hours after application.
glufosinate ammonium	0.37 to 0.45 kg/ha		
REGLONE DESICCANT (240 g/L) plus AGRAL 90 or AG-SURF	1.25 to 2.3 L/ha 1 L/1,000 L	0.5 to 0.92 L/ac 1 L/1,000 L	<ul style="list-style-type: none"> • Apply Preharvest when 80% natural leaf defoliation and 80% of the pods have turned yellow. • Do NOT use on lima or snap beans. • Avoid regrowth by targeting spray within 7 days of bean variety maturity date and harvest 5–7 days after application. • Use 1.25 to 1.7 L/ha by ground and 1.7 to 2.3 L/ha for aerial applications. • Use a minimum of 225 L/ha of spray volume. • Use the higher rate for heavy canopy of crop or weeds. • Do NOT apply if rain is expected within 15 minutes after application.
diquat plus surfactant	0.3 to 0.55 kg/ha 0.1% v/v		

* See Table 4-1. *Herbicides Used in Ontario*, page 21, for formulations available. See label for specific uses and rates.

8. CEREAL CROPS

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

BOLD numbers indicates the weed is listed on the product label for control or suppression.

FIGURE 8-1. CEREAL CROP GROWTH STAGES

WHEAT (SPRING)

Apply all treatments in 100–200 L/ha (40–80 L/ac) of water except where otherwise noted.

Crop rotation is a valuable technique used to prevent the build up of weed populations associated with small grain production. Wild oats can increase in population and severely limit production on fields where small grains are grown continuously. Some weeds (e.g., proso millet) will be well controlled by cereal competition.

Blind harrowing with a light harrow, before emergence of cereals, can help to control small germinating weeds. A light harrow can also be used in cereals up to the 3-leaf stage, or a weeder harrow (L shaped flexible tines) at the 4-leaf stage to provide better control of small annual broadleaf weeds. The timing of these harrowing operations is critical. The weeds must be small and the soil surface must be dry and easily worked.

Weeds must be emerged from the soil surface and in early stages of growth to be killed by the rates of the herbicides used on cereal grains. Weeds that are growing during early periods of cereal growth (up to 5-leaf stage) have the greatest effect on the cereal yield.

The growth stage for maximum safety varies with the cereal and the herbicide. Check the label for appropriate timing. When counting the leaves on cereal plants, some confusion can occur if tiller leaves are present. These leaves are not counted. Figure 8-1, on this page, is useful for identifying the cereal leaf stages that are mentioned in this chapter.

Cereal grains have an advantage in that they do not make use of the full growing season. This is particularly true of the winter cereals where preplant cultivation and postharvest cultivation can be used to stimulate germination of weed seeds and reduce perennial weed populations.

Herbicide Application Timings

- **Preplant (PP)** – Also see Special Methods, *Preplant-Site Preparation Prior To Any Crop*, page 78, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)**
- **Preemergence (PRE)**

Postemergence (POST) – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
BARLEY, OATS AND WHEAT (SPRING), NOT UNDERSEEDED TO FORAGE CROPS			

Postemergence Grass Herbicides

ACHIEVE LIQUID (400 g/L) plus TURBOCHARGE	0.5 L/ha 0.5 L/100 L	0.2 L/ac 0.5 L/100 L	<ul style="list-style-type: none"> • Apply at 1–6 leaf stage of wild oats. • Do NOT use on tame oats. • Apply in 50–100 L/ha of water. • Herbicides not listed on the label may be applied separately 7 days after application of ACHIEVE LIQUID. • Wild oat control will be reduced if REFINE EXTRA is applied before ACHIEVE LIQUID. • Do NOT tank-mix REFINE EXTRA with ACHIEVE LIQUID. • Mature straw may be fed to livestock. One application per year.
tralkoxydim plus adjuvant	0.2 kg/ha 0.5% v/v		
PUMA ¹²⁰ SUPER (120 g/L) fenoxaprop-p-ethyl/safener	0.77 L/ha 92.4 g/L	0.31 L/ac	
			<ul style="list-style-type: none"> • For Use ONLY on spring wheat. • Use for control of wild oats and other grassy weeds. • Apply at the 1- to 6-leaf stage of spring wheat. • PUMA¹²⁰ SUPER contains a safener that enhances the cereal crops ability to metabolize fenoxaprop-p-ethyl. Other products containing fenoxaprop-p-ethyl and that do not contain this special safener (i.e. EXCEL SUPER) will cause unacceptable levels of crop injury.

Postemergence Broadleaf Herbicides

2,4-D (470 g/L)* or 2,4-D (564 g/L)* or 2,4-D (660 g/L)*	0.75 to 1.8 L/ha 0.62 to 1.4 L/ha 0.53 to 1.29 L/ha	0.3 to 0.7 L/ac 0.25 to 0.56 L/ac 0.21 to 0.52 L/ac	<ul style="list-style-type: none"> • Apply when the crop is in the 3–5 leaf stage of growth.
2,4-D*	0.35 to 0.85 kg/ha		
BANVEL II (480 g/L) or ORACLE (480 g/L)	0.23 to 0.29 L/ha	0.09 to 0.12 L/ac	<ul style="list-style-type: none"> • Best performance when weeds are in the 2–3 leaf stage or rosettes less than 5 cm diameter. Use the higher rates on older weeds. • Apply to wheat and barley when they are in the 2–5 leaf stage. • Avoid spraying under conditions of fog, high humidity or when temperatures exceed 30°C.
dicamba	0.11 to 0.139 kg/ha		
BUCTRIL M ((1:1) 560 g/L) or BADGE, LOGIC M, MEXTROL ((1:1) 450 g/L)	1 L/ha 1.25 L/ha	0.4 L/ac 0.5 L/ac	
bromoxynil/ MCPA	0.56 kg/ha		<ul style="list-style-type: none"> • Apply when weeds are in the 1–4 leaf stage and cereals are in the 2 to early flag leaf stage. • Wild buckwheat, common ragweed, mustards and lamb's-quarters are controlled up to the 8 leaf stage. • Best results are obtained with applications at the 2–5 leaf cereal stage since thorough spray coverage of weed foliage is required for optimum weed control.
EMBUTOX (625 g/L) or CALIBER 625 (625 g/L) or COBUTOX 625 (625 g/L)	1.75 to 2.25 L/ha	0.7 to 0.9 L/ac	
2,4-DB	1.1 to 1.4 kg/ha		

* See Table 4-1. Herbicides Used in Ontario, page 21, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
DYVEL ((1:4)420 g/L)	1.25 L/ha	0.5 L/ac	<ul style="list-style-type: none"> • Apply when cereals are in the 2–5 leaf stage. • Hempnettle, corn spurry and cow cockle are controlled best when application is made early in this stage.
<i>dicamba/ MCPA</i>	0.525 kg/ha		
ESTAPROP (582 g/L) or DICHLORPROP D (582 g/L) or TURBOPROP (582 g/L)	1.75 L/ha	0.7 L/ac	<ul style="list-style-type: none"> • For spring wheat and barley only. • Do NOT apply on oats. • Apply to emerged weeds when the cereals are in the 4-leaf to early flag leaf stage.
<i>dichlorprop/ 2,4-D</i>	1.017 kg/ha		
INFINITY	0.83 L/ha	0.33 L/ac	<ul style="list-style-type: none"> • Apply postemergence and prior to flag leaf emergence. • The addition of ammonium sulphate at 1 L/ha (0.4 L/ac) is required for the control of cleavers at the 4–6 whorl growth stage. • Do NOT graze the treated crops or cut for forage or hay within 25 days of application. • Do NOT apply to cereals underseeded with legume crops. • Do NOT harvest wheat or barley for grain or straw within 45 days of application.
<i>pyrasulfotole/bromoxynil</i>	213 kg/ha		
LONTREL 360 (360 g/L)	0.42 to 0.56 L/ha	0.17 to 0.22 L/ac	<ul style="list-style-type: none"> • Apply when wheat or barley are at the 3-leaf to flag leaf emergence stages. • Not registered for use on oats in Eastern Canada. • For the control of Canada thistle and perennial sow-thistle (top growth only).
<i>clopyralid</i>	0.15 to 0.2 kg/ha		
MCPA AMINE (500 g/L)	0.7 to 1.7 L/ha	0.28 to 0.68 L/ac	<ul style="list-style-type: none"> • Apply when the crop is in the 2–5 leaf stage of growth. • For hempnettle control, use the high rate of MCPA.
<i>MCPA*</i>	0.35 to 0.85 kg/ha		
MECOPROP (150 g/L) or COMPITOX (150 g/L)	5.5 to 7 L/ha	2.2 to 2.8 L/ac	<ul style="list-style-type: none"> • Use from the 3-leaf stage to early flag leaf when cereals are 10–15 cm tall. • Apply when weeds are in the 2–4 leaf stage. • Use the higher rate for more mature weeds.
<i>mecoprop-P</i>	0.83 to 1.05 kg/ha		
PARDNER (280 g/L) or KORIL (235 g/L)	1 to 1.2 L/ha 1.2 to 1.4 L/ha	0.4 to 0.48 L/ac 0.48 to 0.56 L/ac	<ul style="list-style-type: none"> • Apply when the weeds are in the 1–4 leaf stage and cereals are in the 2 to early flag leaf stage. Use the higher rate when weeds are past the 4 leaf stage. • Best results are in the 2–5 leaf cereal stage since thorough coverage of weed foliage is required for optimum weed control.
<i>bromoxynil</i>	0.28 to 0.336 kg/ha		
REFINE EXTRA (75 DF) plus AGRAL 90	20 g/ha 2 L /1,000 L	8 g/ac 2 L /1,000 L	<ul style="list-style-type: none"> • Apply when the crop is in the 2-leaf to flag leaf (shot blade) stage. • Apply to young actively growing weeds that are less than 10 cm tall or across. • Canada thistle, sow thistle and round-leaved mallow are suppressed. • Always add water soluble packages to clear water with agitator running. • Do NOT use on Leger Barley and Belvedere Wheat.
<i>thifensulfuron-methyl/ tribenuron-methyl plus non ionic surfactant</i>	15 g/ha 0.2% v/v

Corn (Field,
Seed, Sweet)

9. CORN (FIELD, SEED & SWEET)

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

CORN (FIELD AND SWEET)

Critical Stage: The Critical Stage to control weeds in corn is the 2–8 leaf over stage (3–10 leaf tips).

Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.

Any single method of weed control or the continuous use of the same chemicals can lead to the build-up of weeds resistant or tolerant to that control method. Triazine-resistant lamb's-quarters and pigweed are problematic due to continuous corn and repeated use of triazine herbicides. Rotating to other crops and/or other control methods reduces the chance of new or unique weed infestations.

To control small annual weed seedlings, blind harrow with a set of light harrows at a shallow depth before the corn has emerged, or use a weeder harrow (with L-shaped flexible tines) when the crop is 5–10 cm high. High speed (10 kph), shallow (2.5–3 cm) cultivation with the rotary hoe when corn is 7–8 cm high also helps control small weed seedlings. These techniques will not reduce herbicide action and may in some years enhance chemical weed control. Inter-row cultivation can be used to complement other weed control measures. Row cultivation is most effective when weeds are small. Shallow cultivation will reduce:

- germination of new weed seeds
- moisture loss
- corn root injury

Inter-row cultivation may be required when weeds escape herbicide treatment; consider weeds escapes when they are 5–7 cm high.

Band treatment of chemical over the row reduces cost by one-half to two-thirds, depending on the row spac-

ing and width of band. Shallow inter-row cultivation will be required to control weeds between the bands.

Cultivation gives some control of established perennial weeds but may also help to spread them to previously uninfested areas. Machinery sanitation is important when moving from one field to another. Many perennials (i.e. nutsedge) can be spread on tillage equipment. Custom operators should be particularly careful when moving from one farm to another.

Seed Corn Recommendations

Some field corn recommendations are applicable to seed corn, however, there are inbreds which are susceptible to some chemicals. Check with the contracting company before applying any herbicide. For information on specific weeds see Table 9-1, page 109, and then refer to the appropriate section for details about herbicide treatment.

Nitrogen solution can be used as a carrier, instead of water, for preplant and preemergence application of some herbicides. Weed control activity is not increased. Spray before crop emergence. Consult the herbicide label for proper methods of application and use of dispersing agents. Calibrate the sprayer to apply the required amount of nitrogen. Use stainless steel flood jet nozzles of adequate size (e.g. Teejet TK SS 5 to TK SS 10). Nitrogen solution is mildly corrosive, especially to brass; clean the sprayer immediately after use. UNITE may be used to improve liquid fertilizer herbicide compatibility and stability when a simultaneous application of a liquid fertilizer and liquid or wettable powder herbicide is desired. Because formulations and rates vary, it is essential to read the label to determine the exact amount and method to be used.

Do not apply nitrogen solution with postemergence herbicides.

Special Notes For Corn, Field and Sweet

PRECAUTIONS: Do not use 2,4-D, MCPA, MCPB, 2,4-DB or dicamba later than 2 weeks prior to the first appearance of tassels or ear silk. Use extreme care when applying these herbicides near susceptible crops because of possible herbicide movement. Soybeans, tomatoes and tobacco are extremely sensitive to dicamba and injury symptoms may persist for several weeks. Do not use dicamba in the area of susceptible crops when temperatures exceed 25°C on the day of application or if high humidity is expected, due to the possibility of dicamba volatilizing and injuring susceptible crops nearby. Leave several rows of corn unsprayed when adjacent to soybean fields or other susceptible crops.

Atrazine and Simazine Soil Residues

Atrazine and simazine residues may last for more than one year, particularly if high rates are used more than once and dry weather occurs. If atrazine or simazine is used year after year as in a continuous corn program, triazine residues may be higher. Atrazine when used at rates from 1.2–1.5 kg/ha (active ingredient) on corn generally has not caused injury on succeeding crops of oats, barley, mixed grains, or soybeans, except in years where there was very little rain the previous fall which would slow down atrazine degradation in the soil. Postemergence treatments may persist longer than preemergence treatments. Variations from this generality of 1.2–1.5 kg/ha atrazine may occur across the province.

Injury has been reported on tomatoes, white beans, forage seedlings, peas, tobacco, cucumbers, onions, and turnips following applications of atrazine at more than 1.1 kg/ha (active ingredient) on corn the previous year.

To reduce the hazard of atrazine residues on succeeding crops:

- Apply the early postemergence atrazine oil-water treatment with the lower rate of atrazine: 1.1 kg/ha (active ingredient). With this lower rate, a lower

measure of weed control may result and cultivation may be necessary.

- Fall plowing will reduce TRIAZINE injury more than spring plowing will.
- Moldboard plowing will disperse herbicide residue to a greater soil depth than chisel plowing, thus reducing the concentration of herbicide in the upper soil area.
- Ensure that the sprayer used is adequate and is properly calibrated and adjusted. Spray uniformly without overlaps and do not spray while the sprayer is stopped.

Herbicide Treatments Include

- **Preplant (PP)** – Also see Special Methods, *Preplant Site Preparation Prior To Any Crop*, page 78, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Pay special attention toward machinery cleanliness, and/or treating fields with perennial weeds last.
- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing controls weed escapes and improves herbicide activity in the absence of rainfall.
- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will

frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

CORN LEAF STAGES

Counting leaves on a corn plant may sound like an easy task, but there are complications that can cause miscounting. There are several methods of counting leaves. It is important to know which leaf counting method is being referred to.

One method – the *leaf tip* method – counts all leaves, including any leaf tip that has emerged from the whorl at the top of the plant. (leaf tip method). The *leaf collar* method only counts those leaves that are fully emerged and have the leaf collar showing. The leaf collar is a light green band that separates the leaf blade and leaf sheath that wraps around the stem. In some states they refer to corn growth stages as V1, V2, V3, etc., where a V3 stage is a plant with 3 collars showing.

Publication 75 uses the *leaf over* method, (see Figure 9-1, on page 117) where counting starts with leaves that have emerged from the whorl and the leaf tip is starting to arch over. This normally occurs when leaves are about 50% emerged. Most product labels also use this method of leaf counting, but check the label or with the product representative to be sure. The comparative growth stages table in the next column gives a comparison among the count methods.

Another complication with leaf counting is where on the plant leaf counting begins. In Publication 75, the first leaf is the bottom leaf of the plant. The first leaf is shorter than other leaves and has a round leaf tip. However, as the plant grows the bottom leaves die and drop to the ground. For example, a 10 leaf corn plant may be incorrectly identified as a 7 leaf corn plant because 3 leaves may be “senesed” or fallen off. These

leaves may not be immediately apparent and care must be taken to count them.

Hint: Start counting from the bottom leaf and check the first leaf to look for the rounded leaf tip.

It takes about 75–80 Crop Heat Units to produce each corn leaf. Therefore at temperatures of 30°C day, and 20°C at night, there is one new leaf every 2–3 days; and at 20°C day, and 10°C at night, one new leaf every 5–6 days.

Critical Stage: The Critical Stage to control weeds in corn is the 2–8 leaf over stage (3–10 leaf tips).

Some product labels also use plant height to indicate crop growth stages. In general, plant height is more variable depending on plant genetics and on the weather of the season. The following table gives some comparative heights for each leaf stage but your plants may be slightly more or less than the stage given depending on genetics and weather. The standing height is measured from the ground surface to the top of the plant as it stands. Leaf extended refers to the height of the plant with the leaves pulled up to their full height.

COMPARATIVE GROWTH STAGES				
Leaf Tips	Leaf Collar	Leaf Over	Standing Height (cm)	Leaf Extended (cm)
3	1	2	5–6	5–11
5–6	3	4	9–17	16–25

CORN (FIELD, SEED AND SWEET)

Preplant Burndown and Residual Control

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a "one-pass" weed management program. Refer to Table 9-3. Registered "Two Way" Soil Applied Herbicide Tank-Mixes in Corn, page 146 for a list of registered preplant burndown tank-mixes.
- Refer also to Chapter 6, page 75 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. atrazine, Converge Pro, Primextra II Magnum) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.25 to 1.75 L/ha	0.5 to 0.7 L/ac	<ul style="list-style-type: none"> • Apply PPI or PRE. Set incorporation equipment to work soil no deeper than 10 cm. • Improved control of yellow nutsedge is obtained when DUAL II MAGNUM is applied PPI. • Optimal control of nightshade is obtained when DUAL II MAGNUM is applied PRE. • Do NOT use on muck, peat, or high organic matter soils. • See tank-mixes for treatments to provide annual broadleaf control or follow with sequential postemergence broadleaf herbicide. • Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information.
s-metolachlor/benoxacor	1.14 to 1.6 kg/ha		
ERADICANE (800 g/L)	4.25 to 5.5 L/ha	1.7 to 2.2 L/ac	<ul style="list-style-type: none"> • Must be PPI. • Do NOT use on seed corn.
EPTC/ R25788 (EPTC+)	3.4 to 4.4 kg/ha		
FRONTIER (900 g/L)	1.1 to 1.4 L/ha	0.44 to 0.56 L/ac	<ul style="list-style-type: none"> • Apply PPI or PRE. Set incorporation equipment to work soil no deeper than 10 cm. • Improved control of yellow nutsedge is obtained when FRONTIER is applied PPI. Minimum PPI rate is 1.125 kg/ha. • Use the higher rate of FRONTIER for the control of nightshade and pigweed. • Do NOT use on muck, peat, or high organic matter soils. • See tank-mixes for treatments to provide annual broadleaf control or follow with sequential postemergence broadleaf herbicide. • Do NOT use on seed corn or popcorn. • Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information.
dimethenamid	1 to 1.25 kg/ha		
FRONTIER (900 g/L)	1.1 to 1.25 L/ha	0.44 to 0.5 L/ac	<ul style="list-style-type: none"> • For preemergence use on seed corn, • Use the lower rate on soils of lower organic matter and the higher rate on medium and fine textured soils. • Consult the seed corn company for information on the tolerance of seed corn inbred lines prior to the use of FRONTIER herbicide.
dimethenamid	1 to 1.125 kg/ha		

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
Soil Applied Broadleaf Herbicides			
atrazine (480 g/L)	2.1 to 3.1 L/ha	0.84 to 1.24 L/ac	<ul style="list-style-type: none">• Apply PRE.• Weeds will normally emerge and die within a few days; atrazine can persist for varying lengths of time; longer under dry, cool weather and coarse textured soils. See tank-mixes for reducing rates and avoiding residues, and for treatments to provide annual grass control.• Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information.
atrazine	1.01 to 1.49 kg/ha	0.45 to 0.66 kg/ac	
atrazine (480 g/L) plus BANVEL II (480 g/L) or ORACLE (480 g/L)	2.1 to 3.1 L/ha 1.25 L/ha	0.84 to 1.24 L/ac 0.5 L/ac	<ul style="list-style-type: none">• Apply PRE.• This treatment should provide good control of triazine resistant broadleaf weeds and velvetleaf.• See notes on atrazine with respect to residues, on page 120.• See precautions for BANVEL II or ORACLE applied alone.• Do NOT apply to coarse (sand) textured soils with less than 2% organic matter.• Do NOT use on seed corn or sweet corn.
atrazine plus dicamba	1.01 to 1.49 kg/ha 0.6 kg/ha		
BANVEL II (480 g/L) or ORACLE (480 g/L)	1.25 L/ha	0.5 L/ac	<ul style="list-style-type: none">• Apply PRE to corn seed planted 4 cm or more deep before weeds and corn emerge. If corn seed is less than 4 cm below the soil surface, delay application of BANVEL II until the spike stage of corn.• Apply to medium to fine textured soils containing more than 2.5% organic matter.• Do NOT apply to coarse (sand) textured soils with less than 2% organic matter.• Do NOT incorporate.
dicamba	0.6 kg/ha		
CALLISTO (480 g/L)	0.3 L/ha	0.12 L/ac	<ul style="list-style-type: none">• Apply PRE to field, seed or sweet corn.
mesotrione	0.140 kg/ha		
MARKSMAN ((1:2) 401 g/L)	3.7 to 4.5 L/ha	1.5 to 1.8 L/ac	<ul style="list-style-type: none">• Apply PRE.• See notes on atrazine with respect to residues, on page 120.• See precautions for BANVEL II applied alone.• Do NOT apply to coarse (sand) textured soils with less than 2% organic matter.• Do NOT use on seed corn or sweet corn.
dicamba/atrazine	1.5 to 1.8 kg/ha		
Soil Applied Grass and Broadleaf Herbicides			
BATTALION' (ELIM EP (25 DF) + DUAL II MAGNUM (915 g/L) + BANVEL II (480 g/L))	60 g/ha + 0.75 L/ha + 0.75 L/ha	24 g /ac + 0.3 L/ac + 0.3 L/ac	<ul style="list-style-type: none">• Apply PRE.• See precautions for BANVEL II or ORACLE alone, on this page.• Do NOT incorporate.• BATTALION can be applied with 28% UAN as a carrier (PRE only).• For suppression of quackgrass, apply BATTALION at the 1-6 leaf stage of quackgrass.• Do NOT use on seed corn or sweet corn.• BATTALION is a co-pack of ELIM EP, DUAL II MAGNUM and BANVEL II.
rimsulfuron + s-metolachlor/benoxacor + dicamba	15 g/ha + 684 g/ha + 360 g/ha		

'Indicates herbicide sold as a co-pack under this trade name.

--	--	--------------------------	---

Postemergence Grass and Broadleaf Herbicides – for Roundup Ready (glyphosate tolerant) hybrids only

glyphosate (360 g/L) or glyphosate (480 g/L) or glyphosate (540 g/L)	2.5 to 5 L/ha 1.875 to 3.75 L/ha 1.67 to 3.34 L/ha	1 to 2 L/ac 0.75 to 1.5 L/ac 0.67 to 1.34 L/ac	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as glyphosate tolerant or "ROUNDUP READY CORN". See Table 4-2, page 59, for a list of registered glyphosate products. Apply up to and including the 8-leaf stage of corn. The initial application is recommended between the 2–6 leaf stage (3–5 leaf is optimum timing) to remove early competition. A second application may be applied up to the 8-leaf stage of corn (8-leaf fully expanded). Use 100–200 L/ha (40–80 L/ac) of water.
glyphosate*	0.9 kg/ha		

Postemergence Tank-Mixes – for Roundup Ready (glyphosate tolerant) hybrids only

GALAXY [†] ELIM EP (25 DF) + ROUNDUP WEATHERMAX (540 g/L)	50 g/ha + 1.67 L/ha	20 g/ac + 0.67 L/ac	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as glyphosate tolerant or "ROUNDUP READY CORN". Apply spike to the 6-leaf stage corn. Use on corn with corn heat units (CHU) greater than 2500. Water Volume: 140–190 L/ha. Symptoms appear after 5–7 days, but may not be noticeable for 2–3 weeks. Provides residual control of fall panicum, green foxtail, lamb's-quarters and pigweed spp.
rimsulfuron + glyphosate	12.5 g/ha + 0.9 kg/ha		
glyphosate (360 g/L)** or glyphosate (540 g/L)** plus ATRAZINE 480 (480 g/L)	2.5 L/ha 1.67 L/ha 1.56 to 2.1 L/ha	1 L/ac 0.67 L/ac 0.63 to 0.85 L/ac	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as glyphosate tolerant or "ROUNDUP READY CORN". Apply up to and including the 5-leaf stage of corn. Atrazine will provide residual control of broadleaf weeds.
glyphosate plus atrazine	0.9 kg/ha 0.75 to 1.0 kg/ha		
glyphosate (360 g/L)** plus CALLISTO (480 g/L) plus AATREX LIQUID (480 g/L) plus non-ionic surfactant	2.5 L/ha 0.21 L/ha 0.58 L/ha 2 L/1,000 L	1.0 L/ac 0.085 L/ac 0.235 L/ac 2 L/1,000 L	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as glyphosate tolerant or "ROUNDUP READY CORN". Apply up to and including the 8-leaf stage of corn. CALLISTO and Atrazine will provide residual broadleaf weed control. Refer to Table 9-5, page 149 for a complete list of glyphosate products that can be tank-mixed with CALLISTO plus AATREX LIQUID.
glyphosate plus mesotrione plus atrazine plus non-ionic surfactant	0.9 kg/ha 0.1 kg/ha 0.28 kg/ha 0.2% v/v		

[†] Indicates herbicide sold as a co-pack under this trade name.

* Numerous products exist, refer to Table 4-1, *Herbicides Used in Ontario*, page 21 for more information.

** Refer to Table 9-5, *Glyphosate Products and "Two-Way" Tank-Mixes*, page 149 for a list of registered glyphosate products for this tank-mix.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
glyphosate (360 g/L)** or glyphosate (540 g/L)** plus MARKSMAN ((1:2) 401 g/L)	2.5 L/ha 1.67 L/ha 2.5 to 3.7 L/ha	1 L/ac 0.67 L/ac 1 to 1.5 L/ac	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as "ROUNDUP READY CORN". Apply up to and including the 5-leaf stage of corn. Marksman will provide residual control of broadleaf weeds. See precautions for BANVEL II or ORACLE applied POST, page 130.
glyphosate plus dicamba/atrazine	0.9 kg/ha 1 to 1.5 kg/ha		
glyphosate (360 g/L)** plus PRIMEXTRA II MAGNUM (1:0.8) 720 g/L)	2.5 L/ha 2.5 L/ha	1.0 L/ac 1.0 L/ac	<ul style="list-style-type: none"> Use ONLY with pedigreed (certified) corn seed designated as glyphosate tolerant or "ROUNDUP READY CORN". Apply up to and including the 6-leaf stage of corn. PRIMEXTRA II MAGNUM will provide residual grass and broadleaf weed control. For tank-mixtures of PRIMEXTRA II MAGNUM plus any of the glyphosate products, to ensure optimum compatibility: Add PRIMEXTRA II MAGNUM to the tank first, then add AGRAL 90, AGSURF or COMPANION at 2.5 L/ 1000 L. Continue agitation and add the glyphosate mix partner. Refer to Table 9-5, page 149 for a complete list of glyphosate products that can be tank-mixed with PRIMEXTRA II MAGNUM.
glyphosate plus s-metolachlor/benoxacor/ atrazine	0.9 kg/ha 1.8 kg/ha		
Directed Postemergence			
LOROX L 480 (480 g/L)	2.4 to 4.5 L/ha	0.96 to 1.8 L/ac	<ul style="list-style-type: none"> Apply in oil water emulsion as directed spray at low pressure with drop nozzles after corn is 30 cm or more in height.
linuron	1.1 to 2.25 kg/ha		<ul style="list-style-type: none"> The spray must be placed under the corn leaves but on the weeds. Use this treatment as a rescue from weeds escaping a previous treatment and for nutsedge or horsetail top growth burn down. Do not apply linuron after corn is beginning to tassel.
MCPA AMINE (500 g/L)	0.76 to 1.26 L/ha	0.3 to 0.5 L/ac	<ul style="list-style-type: none"> Controls triazine resistant and most other broadleaf weeds.
MCPA	0.38 to 0.63 kg/ha		<ul style="list-style-type: none"> Use the lower rate for small, actively growing weeds and the higher rate for larger weeds or under adverse weather conditions. Top growth of fully developed horsetail (15–25 cm) can be controlled with 1 L/ha (0.4 L/ac) of product; a directed late post application using drop nozzles to avoid corn injury is necessary. Do NOT use on seed corn or sweet corn.
ULTIM ((1:1) 75 DF) plus PARDNER (280 g/L) or KORIL (235 g/L) plus non-ionic surfactant	33 g/ha 1 L/ha 1.2 L/ha 2 L/1,000 L	13 g/ac 0.4 L/ac 0.5 L/ac 2 L/1,000 L	<ul style="list-style-type: none"> Delay application until 8-leaf stage of corn, when a height differential can be established between the corn and target weeds. Apply before the initiation of corn silking. Direct spray solution below crop canopy. Apply one water soluble bag/ha of ULTIM. Provides later season quackgrass control. Do NOT use on seed corn or sweet corn.
nicosulfuron/rimsulfuron plus bromoxynil plus non-ionic surfactant	25 g/ha 0.28 kg/ha 0.2% v/v		

** Refer to Table 9-5. Glyphosate Products and "Two-Way" Tank-Mixes, page 149 for a list of registered glyphosate products for this tank-mix.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
ULTIM ((1:1) 75 DF) plus non-ionic surfactant	33 g/ha 2 L/1,000 L	13 g/ac 2 L/1,000 L	<ul style="list-style-type: none">• Delay application until 8-leaf stage of corn, when a height differential can be established between the corn and target weeds. Application should be made before the initiation of silking. Direct spray solution below crop canopy. Apply one water soluble bag/ha of ULTIM.• Provides later season quackgrass control.• Do NOT use on seed corn or sweet corn.
nicosulfuron/rimsulfuron plus non-ionic surfactant	25 g/ha 0.2% v/v		
Directed Postemergence – for Liberty tolerant hybrids only			
LIBERTY 200 SN (200 g/L)	1.5 to 2.5 L/ha	0.6 to 1 L/ac	<ul style="list-style-type: none">• Use ONLY on field and seed corn specially developed to be tolerant to LIBERTY.• Application after the 8-leaf stage of corn must be made as a directed spray below the whorl of the corn plant.• LIBERTY is a contact herbicide and has no residual soil activity. Consult the product label for rate recommendations for specific weeds and weed stages. Ammonium sulphate can be added at 6 L/ha (2.4 L/ac) (liquid) or 3.3 kg/ha (1.3 kg/ac) (dry) for improved control of specific weeds.• Do NOT add oil or any other surfactants.
glufosinate ammonium	0.3 to 0.5 kg/ha

Expressed as leaf stages except as indicated.

10. FORAGE CROPS

Notes: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavourable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

✓ Indicates herbicide registered for use.

✓ Insufficient information available to make a rating.

¹ On established legumes, use fall spot treatment only.

BOLD numbers indicate the weed is listed on the product label for control or suppression.

² Various formulations available, see Table 4-1, page 21. See label for specific uses and rates.

³ For seed crops only.

⁴ CLOVITOX PLUS and TOPSIDE not for established clovers.

⁵ Do not use on sweet clover.

⁵ SIMADEX not for established alfalfa.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

FORAGE GRASSES (SEED PRODUCTION ONLY)

Herbicide Treatments include:

- **Preplant (PP)** – Also see Special Methods, *Preplant-Site Preparation Prior To Any Crop*, on page 78 for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.
- **Preemergence (PRE)**
- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

Apply all treatments in 100–200 L/ha (40–80 L/ac) water except where otherwise noted.

tralkoxydim	0.2 kg/ha	
plus adjuvant	0.5% v/v	

- Apply to wild oats, volunteer oats, green foxtail and yellow foxtail prior to tillering. Applications made to weeds that have tillered may result in unacceptable control.
- **For the following forage grasses grown for seed only:**
 - Seedling and established intermediate and crested wheatgrass, creeping red fescue, meadow and smooth brome grass either underseeded to cereals or grown alone.
 - For establishment of northern wheatgrass, western wheatgrass and slender wheatgrass.
- **Do NOT** tank mix ACHIEVE liquid with any other herbicides, insecticides, fungicides, fertilizers, micronutrients or adjuvants other than those listed on the label.

PASTURE RENOVATION WITH BIRD'S-FOOT TREFOIL

The introduction of this legume into a pasture requires control of competition from weeds and forage grasses for the first 2–4 months after the legume seed begins to germinate. Control of established perennial weeds should start at least one year before the legume seeding operation. Treatments recommended in Chapter 6 of this publication could be used. If the field cannot be plowed and worked to prepare a seedbed, one of the following chemical treatments can be used to suppress the sod.

The success of these programs depends on many management factors such as inoculation of the trefoil seed as well as control of fertility and grazing.

Postemergence Grass and Broadleaf Herbicides

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

PASTURES (MOSTLY GRASSES)

Biennials: Unless otherwise noted, most chemicals are best applied in early fall to first year growth or in late spring to second year growth.

Perennials: Unless otherwise noted, apply in late spring (end of May to mid-June) when weeds are actively growing. Overgrazing tends to thin the grass stand and allows the establishment of weeds. Undergrazing allows weeds like wild carrot to form and spread seed. Timely mowing can prevent the ripening of weed seeds and reduce the distance these seeds spread with the wind.

- Chemicals are available to control most of the troublesome weeds in grass pastures and these can give faster kill of established weeds than any other management practice. A chemical may have to be applied more than once to kill established perennial weeds and the new crop of weeds that emerges through a thin grass stand. A poor grass stand can be improved by using a combination of chemicals, fertility and grazing management.
- Extend chemical weed control into fencerows and other areas around the pasture to keep these areas from becoming sources of weed seeds.
- Generally, clovers are severely damaged by chemical treatments. However, white clover and black medic show some resistance and re-establish quickly.
- Consult the label to determine the period of time to keep livestock out of the treated area.
- Prevent grazing where poisonous plants (water hemlock, buttercup, chokecherry, etc.) may be made more attractive to livestock after the chemical treatment. It is a good practice to prevent grazing on the field for at least a week after spraying to reduce the chances of the livestock consuming harmful plants.
- Apply chemical treatments in at least 200 L/ha (80 L/ac) water and increase this rate if it is necessary to contact weeds through dense vegetation.
- Avoid drift or vapour drift from 2,4-D or dicamba onto susceptible crops by using drift reducing techniques such as high spray volume, coarse droplets or anti-drift nozzles.

2,4-D (470 g/L)	1.8 to 2.34 L/ha	0.72 to 0.94 L/ac
or 2,4-D (564 g/L)*	1.5 to 1.95 L/ha	0.6 to 0.78 L/ac
or 2,4-D (660 g/L)*	1.29 to 1.67 L/ha	0.52 to 0.67 L/ac

2,4-D* 0.85 to 1.1 kg/ha

- Use the low rate for chicory.
- Use the high rate for:
 - Goldenrod.
 - Yellow rocket: Mow before spraying if plants are in flowering stage.
 - Blueseed and burdock: Apply as low volatile ester.
 - Wild carrot: Early spring or early fall. If 2,4-D resistant strains are present, mow to reduce seed spread.
 - Goat's-beard: Early spring or early fall.
 - Milkweed: Spray undersides of leaves. Only top growth is killed.
 - Water hemlock: Apply in May or June.
 - Dandelion: Can also apply in September.

2,4-D (470 g/L)	2.34 to 3.72 L/ha	0.94 to 1.49 L/ac
or 2,4-D (564 g/L)*	1.95 to 3.1 L/ha	0.6 to 1.24 L/ac
or 2,4-D (660 g/L)*	1.29 to 2.65 L/ha	0.52 to 1.06 L/ac

2,4-D* 1.1 to 1.75 kg/ha

2,4-D (470 g/L)	4.5 L/ha	1.8 L/ac
or 2,4-D (564 g/L)*	3.99 L/ha	1.6 L/ac
or 2,4-D (660 g/L)*	3.40 L/ha	1.36 L/ac

2,4-D* 2.25 kg/ha

- For ox-eye daisy and hawk's-beard: Use 2 treatments, one in late spring and the second in early September if there is sufficient growth.
- For tansy ragwort.
- Apply to rosettes in spring or fall.
- Retreat as necessary to control new seedlings and regrowth.

* See Table 4-1, Herbicides Used in Ontario, page 21, for formulations available. See label for specific uses and rates.

11. SOYBEANS

Notes: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

SOYBEANS

Unless otherwise specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

Thoroughly clean all equipment used to apply ACCENT, ACCENT I-PASS, ACCENT TOTAL, BANVEL II, BATTALION, DISTINCT, LONTREL, MARKSMAN, MCPA, ORACLE, PEAKPLUS, SHOTGUN, SUMMIT, SUMMIT EXTRA, 2,4-D and other related herbicides immediately after use, as well as before spraying soybeans. See *Cleaning the Sprayer*, on page 12.

Total Weed Control System – Although herbicides themselves may be effective, there is a benefit to using

all the weed control methods available to obtain the best control possible. Crop rotation, herbicide rotation, early weed control with a rotary hoe, harrowing, cultivating and preventing the spread of weeds as much as possible are all a part of weed management. See Chapter 9, on page 109, for details of each of these methods.

Triazine Residues – When soybeans follow corn treated with triazines such as atrazine or simazine the previous year, and if triazine residues remain, they may interact with herbicides used for weed control in soybeans and cause crop injury. Examples of such soybean herbicides include the triazine based herbicide metribuzin (SENCOR) or the substituted urea herbicides (LOROX). The potential for injury is greater

during adverse weather conditions, in shorter season soybean growing areas and/or in soils with a high pH. Do not confuse herbicide injury symptoms with cold injury symptoms. See *Atrazine and Simazine Soil Residues*, on page 120.

Resistant Weeds – Biotypes of a number of weeds have been found resistant to Group 5 (triazine) and Group 2 herbicides. Refer to *Managing Weed Resistance to Herbicides*, on page 5, for management and control strategies.

Specific Weeds – For information on specific weeds see the Table 11-1, on page 167. Then refer to the appropriate section for details about herbicide treatments.

Herbicide Treatments include:

- **Preplant (PP)** – See Special Methods, *Preplant-Site Preparation Prior To Any Crop*, on page 78, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread per-

ennial weeds to previously uninfested areas. Ensure machines are clean and/or treat fields with perennial weeds last.

- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall.

- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
--	--	--------------------------	---

Preplant Burndown Herbicides – Refer also to Chapter 6, page 75.

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a “one-pass” weed management program.
- Refer to Chapter 6, page 75 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. SENCOR, LOROX L) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

CLEANSTART PLUS ¹ CREDIT PLUS (360 g/L) + AIM EC (240 g/L)	2.5 L/ha + 73 mL/ha	1.0 L/ac + 30 mL/ac	<ul style="list-style-type: none"> • Apply to actively growing weeds, up to 10 cm. • Coverage of weed foliage is essential for control. • Only weeds emerged at application will be controlled. • CLEANSTART PLUS¹ provides no residual weed control. • CLEANSTART PLUS¹ is a co-pack of CREDIT PLUS and AIM EC.
glyphosate + carfentrazone-ethyl	0.9 + 0.0175 kg/ha		
GUARDIAN ¹ TOUCHDOWN iQ (360 g/L) + CLASSIC (25 DF)	2.5 L/ha + 36 g/ha	1 L/ac + 14 g/ac	<ul style="list-style-type: none"> • Apply as a PP burndown. • Some rotational restrictions apply (see CLASSIC label and Table 4-3, page 60). • GUARDIAN is a co-pack of TOUCHDOWN iQ + CLASSIC.
glyphosate + chlorimuron-ethyl	0.9 kg/ha + 9 g/ha		

Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.15 to 1.75 L/ha	0.46 to 0.7 L/ac	<ul style="list-style-type: none"> • Apply PP, PPI or PRE. • Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information. • Control of yellow nutsedge is obtained when DUAL II MAGNUM is applied PPI. • Optimal control of nightshade is obtained when DUAL II MAGNUM is applied PRE. • Do NOT use on muck, peat or high organic matter soils. • Use the higher rate of (DUAL II MAGNUM) for heavier weed populations. • Incorporation depth should not exceed 10 cm.
s-metolachlor/benoxacor	1.05 to 1.6 kg/ha		

¹Indicates herbicide sold as a co-pack under this trade name.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
FRONTIER (900 g/L) dimethenamid	1.1 to 1.4 L/ha 1 to 1.25 kg/ha	0.44 to 0.56 L/ac	<ul style="list-style-type: none"> • Apply PP, PPI or PRE. • Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information. • Use higher rate of FRONTIER for the control of nightshade and pigweed (PPI or PRE only). • Control of nutsedge is achieved by applying FRONTIER preplant incorporated. • Minimum rate for preplant incorporated treatments is 0.5 L/ac. • Incorporation depth should not exceed 10 cm.
TREFLAN (480 g/L) or RIVAL (500 g/L) or BONANZA 400 (400 g/L)	1.25 to 2.4 L/ha 1.2 to 2.3 L/ha 1.5 to 2.75 L/ha	0.5 to 0.96 L/ac 0.48 to 0.92 L/ac 0.6 to 1.1 L/ac	<ul style="list-style-type: none"> • Apply PPI. • Conduct first incorporation as soon as possible after application, may be delayed up to 8–24 hours. Second incorporation is recommended anytime before planting.
trifluralin	0.6 to 1.155 kg/ha		
Soil Applied Broadleaf Herbicides			
FIRSTRATE (84 WG) cloransulam-methyl	41.7 g/ha 35 g/ha	17 g/ac	<ul style="list-style-type: none"> • Apply PRE. • Apply in both conventional and conservation tillage systems. • Some rotational cropping restrictions apply (see Table 4-3, page 60).
LOROX DF (50 DF) or LOROX L (480 g/L) linuron	2.26 to 4.5 kg/ha 2.25 to 4.5 L/ha 1.13 to 2.25 kg/ha	0.9 to 1.8 kg/ac 0.9 to 1.8 L/ac	<ul style="list-style-type: none"> • Apply PRE. • Can be tank-mixed with glyphosate for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information. • Do NOT use on sands (less than 2%–3% organic matter). • Plant soybeans at least 4 cm deep. • Heavy rainfall and adverse weather conditions may result in temporary crop injury. • Use higher rate for muck soils and clay soils. • LOROX DF can be applied as preplant tank-mixes at a reduced rate (0.68–0.8 kg/ha). (See <i>Soil Applied Tank-Mix Options</i>, page 177).
SENCOR 75 DF (75 WG) metribuzin	0.75 to 1.5 kg/ha 0.56 to 1.12 kg/ha	0.3 to 0.6 kg/ac	<ul style="list-style-type: none"> • Apply PP, PPI or PRE. • Can be tank-mixed with glyphosate or GRAMOXONE for PP burndown of emerged annual and perennial weeds, see Chapter 6, page 75 for more information. • Do NOT use on sandy or coarse soils with less than 2% organic matter. • Use the recommended rate for each soil types (see label), otherwise crop injury may occur. • Excessive rainfall and adverse weather conditions may result in crop injury. • Plant soybeans at least 4 cm deep. • For preplant applications: <ul style="list-style-type: none"> – apply up to 30 days prior to seeding the crop. – use the higher rate when weeds are dense and are on soils with high organic matter (over 4%) and on soils with high clay content. – if emerged weeds are taller than 4 cm, apply in tank-mix with glyphosate. • Some rotational cropping restrictions apply (see Table 4-3, page 60).

Postemergence Grass Herbicides			
ASSURE II (96 g/L) plus SURE-MIX	0.38 to 0.75 L/ha 5 L/1,000 L	0.15 to 0.3 L/ac 5 L/1,000 L	<ul style="list-style-type: none"> • Apply to emerged annual grasses and volunteer cereals in 2-leaf to tillering stage and volunteer corn and quackgrass in the 2–6 leaf stage. • Use the 0.38 L/ha (0.15 L/ac) rate of ASSURE II for control of volunteer corn, volunteer cereals, long spined sandbur and green foxtail. • The 0.5 L/ha (0.2 L/ac) rate of ASSURE II will suppress quackgrass and also control barnyard grass. • Use the 0.75 L/ha (0.3 L/ac) rate of ASSURE II for control of quackgrass. • Do NOT apply to soybeans within 80 days of harvest.
quizalofop-p-ethyl plus oil concentrate	0.036 to 0.072 kg/ha 0.5% v/v		
EXCEL SUPER (80.5 g/L)	0.67 L/ha	0.27 L/ac	
fenoxaprop-p-ethyl	0.054 kg/ha		
POAST ULTRA (450 g/L) plus ASSIST or MERGE	0.32 to 0.47 L/ha 2 L/ha 1 L/ha	0.13 to 0.19 L/ac 0.8 L/ac 0.4 L/ac	<ul style="list-style-type: none"> • Apply the 0.47 L/ha (0.19 L/ac) rate for wild oats or volunteer cereal control. • Apply POAST ULTRA to emerged grasses in the 1–6 leaf stage during active growth while crop is small enough to permit thorough spray coverage. • Complete control is normally obtained 7–21 days after application. A second application may be necessary to control grasses that emerge after the first treatment. • Use MERGE for conditions or weeds requiring medium to high rates of POAST ULTRA. • Water rates of 100–200 L/ha (40–80 L/ac) provide the best results.
sethoxydim plus oil concentrate or plus surfactant/solvent	0.15 to 0.2 kg/ha 2 L/ha 1 L/ha		
POAST ULTRA (450 g/L) plus MERGE	1.1 L/ha 1 to 2 L/ha	0.45 L/ac 0.4 to 0.8 L/ac	
sethoxydim plus surfactant/solvent	0.5 kg/ha 1 to 2 L/ha		
SELECT (240 g/L) plus AMIGO	0.125 to 0.375 L/ha 5 to 10 L/1,000 L	0.05 to 0.15 L/ac 5 to 10 L/1,000 L	<ul style="list-style-type: none"> • Soybeans are tolerant at any growth stage. • Apply when annual grasses and volunteer cereals are in the 2–6 leaf stage. • Use the higher rate for quackgrass control. Apply to quackgrass in the 2–5 leaf stage. • Add the surfactant AMIGO at 5L/1,000 L of spray solution to the low herbicide rate and 10L/1,000 L of spray solution to the high herbicide rate for quackgrass control.
clethodim plus surfactant	0.03 to 0.09 kg/ha 0.5% to 1% v/v		
VENTURE L (125 g/L)	0.6 L/ha	0.243 L/ac	<ul style="list-style-type: none"> • Apply at the 2–5 leaf stage of volunteer corn.
fluzafop-P-butyl	0.075 kg/ha		
VENTURE L (125 g/L)	1 to 2 L/ha	0.4 to 0.8 L/ac	
fluzafop-P-butyl	0.125 to 0.25 kg/ha		<ul style="list-style-type: none"> • Apply at the 2–4 leaf stage of annual grasses and the 3–5 leaf stage of quackgrass or wirestem muhly. Use the 2 L/ha rate of VENTURE for wirestem muhly.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
Postemergence Broadleaf Herbicides			
BASAGRAN FORTÉ (480 g/L)	1.75 to 2.25 L/ha	0.7 to 0.9 L/ac	<ul style="list-style-type: none"> • Apply when soybeans are in unifoliolate to 4th trifoliolate leaf stage and when weeds are small and actively growing. • Temporary crop injury may occur under abnormally hot, humid conditions. • Cool weather or drought may delay control. • For improved and more consistent control of velvetleaf and lamb's-quarters, 10 L/ha of 28% urea ammonium nitrate (UAN) or 6 L/ha of liquid ammonium sulphate may be added. The addition of either nitrogen source may cause slight leaf burn, but new growth is normal and crop vigour is not reduced. • Use the higher rate of BASAGRAN FORTÉ when weed pressure is high, weeds are large or conditions for activity are unfavourable.
<i>bentazon</i>	0.84 to 1.08 kg/ha		
BLAZER (240 g/L)	2.5 L/ha	1 L/ac	<ul style="list-style-type: none"> • Apply to emerged weeds up to 10 cm in height (refer to labels for weed heights) when soybeans are in the 1–3 trifoliolate leaf stage. • Do NOT apply before the first trifoliolate leaf stage of the soybeans. • Good spray coverage on the weeds is important for good weed control. • Soybeans may exhibit speckling, bronzing and/or leaf burn. The trifoliolate leaf emerging at the time of application may be distorted. Soybeans usually outgrow these conditions and continue to grow at a normal rate with no adverse effect on vigour, maturity, or crop yield. • Do NOT apply BLAZER to soybeans that have been subjected to stress (see product label). • Do NOT add oils or surfactants to applications of BLAZER at 2.5 L/ha alone.
<i>acifluorfen</i>	0.6 kg/ha		
BLAZER (240 g/L) plus ASSIST	1.25 L/ha 5 L/1,000 L	0.5 L/ac 5 L/1,000 L	<ul style="list-style-type: none"> • Apply to emerged redroot pigweed up to and including the 4-leaf stage and to common ragweed up to and including the 8-leaf stage when soybeans are in the 1–3 trifoliolate leaf stage. • Do NOT apply before the first trifoliolate leaf stage of the soybeans. • Good spray coverage on the weeds is important for good weed control. • Soybeans may exhibit speckling, bronzing and/or leaf burn. The trifoliolate leaf emerging at the time of application may be distorted. Soybeans usually outgrow these conditions and continue to grow at a normal rate with no adverse effects on vigour, maturity or crop yield.
<i>acifluorfen</i> plus oil concentrate	0.3 kg/ha 0.5% v/v		
CLASSIC (25 DF) plus non-ionic surfactant	36 g/ha 2 L/1,000 L	14 g/ac 2 L/1,000 L	<ul style="list-style-type: none"> • Do NOT use on soils with pH \geq 7.8. • Optimal timing for broadleaf control is when the soybeans are in the 1–3 trifoliolate stage of growth. • Do NOT apply before the first trifoliolate is fully expanded or after the initiation of flowering. • Addition of 28% UAN is recommended for improved control of velvetleaf.
<i>chlorimuron-ethyl</i> plus non-ionic surfactant	9 g/ha 0.2% v/v		

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
FIRSTRATE (84 WG) plus non-ionic surfactant plus liquid fertilizer (28-0-0 or 32-0-0)	20.8 g/ha 2.5 L/1,000 L 25 L/1,000 L	8.5 g/ac 2.5 L/1,000 L 25 L/1,000 L	<ul style="list-style-type: none"> • Apply up to the 8-leaf stage for common ragweed and cocklebur, 6-leaf stage for giant ragweed, and 4-leaf stage for velvetleaf. • Apply any time prior to flowering stage of soybeans. • Application prior to full emergence of first trifoliolate may cause temporary yellowing of soybeans.
cloransulam-methyl plus non ionic surfactant plus liquid fertilizer	17.5 g/ha 0.25% v/v 2.5% v/v		
PINNACLE (75 DF) plus non ionic surfactant	5.5 to 8 g/ha 1 L/1,000 L	2.2 to 3.2 g/ac 1 L/1,000 L	<ul style="list-style-type: none"> • Apply to emerged weeds up to 10 cm in height when soybeans have the first trifoliolate leaf fully expanded. • Do NOT apply to soybeans, which have initiated flowering. • Use the higher rate for lamb's-quarters and velvetleaf. • The addition of UAN (28-0-0) at 4% v/v will enhance the control of velvetleaf.
thifensulfuron-methyl plus surfactant	4.1 to 6 g/ha 0.1% v/v		
REFLEX (240 g/L) plus AGRAL 90 or TURBOCHARGE	1 L/ha 2.5 L/1,000 L 5 L/1,000 L	0.4 L/ac 2.5 L/1,000 L 5 L/1,000 L	<ul style="list-style-type: none"> • Apply early postemergence at 1–2 trifoliolate to crop when weeds are small and actively growing (2–4 leaf stage). • Use 200–350 L/ha (80–140 L/ac) water. Use higher rates of water and pressure for a heavy weed or crop canopy. • Some bronzing may occur to soybean leaves at the time of application, but plants outgrow these effects without harming maturity or yield. • Do NOT apply Reflex to any field more often than once every 2 years. • Do NOT apply to soybeans under stress. • Some rotational cropping restrictions apply (see Table 4-3, page 60).
fomesafen plus non-ionic surfactant or plus mineral oil/surfactant	0.24 kg/ha 0.25% v/v 0.5% v/v		
Postemergence Grass and Broadleaf Herbicides

12. OTHER FIELD CROPS

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

✓ Can be used on this crop.

? Insufficient information available to make a rating.

² Use only on crops planted with certified canola seed designated as "Pursuit Tolerant" Canola.

BOLD numbers indicates the weed is listed on the product label for control or suppression.

Herbicide Treatments include:

- **Preplant (PP)** – Also see Special Methods, *Preplant-Site Preparation Prior To Any Crop*, page 78, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Ensure

machines are clean and/or treat fields with perennial weeds last.

- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall.

- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

SUNFLOWERS

Cultural control of weeds in sunflowers can be used successfully, but only if weeds are also controlled in other crops in the rotation. There are several tillage options in the sunflower crop.

Preplant tillage can control 1 or 2 flushes of early germinating weeds. Plant sunflowers immediately after the last tillage operation.

A rotary hoe set to cultivate shallow can be effective in removing annual weeds that are just emerging. It is not very useful for controlling well-rooted seedlings.

Spring tooth harrows can be used to control small weeds when sunflowers are in the 4–6 leaf stages. There will be some damage to sunflowers and larger weeds will not be well controlled.

One or 2 cultivations with a row crop cultivator are the most common form of cultural control. Sunflowers have to be big enough to withstand burial. Lateral roots on sunflowers are shallow, so avoid cultivating too deep or too close to plants.

Sunflowers – Soil Applied Grass Herbicides

13. VEGETABLE CROPS

More than 50 vegetable crops are grown commercially in Ontario. Some are seeded, some transplanted, some are annuals, and other crops are perennial, presenting a very diverse group of situations to manage weeds. Weed management involves all aspects of weed control in vegetable crops including herbicides, cultivation, hoeing, mulches, weed prevention.

Perennial weeds are often a more severe problem in perennial horticultural crops such as asparagus. Control quackgrass, bindweed, thistles, horsetail and dandelions before these crops are planted.

Recommendations for snap beans or sweet corn are listed in the field crop section (Beans, page 85 and Corn, page 109) because they are similar to those for field corn and field beans. Differences are noted where necessary.

Treatments listed for horticultural crops in the publication are based on extensive research trials. Do not use herbicides in cold frames or greenhouses unless specifically recommended.

Horticultural crops are often high value crops. Weed competition is costly. Improper application of herbicides also can be costly. Sprayers used for hormone type herbicides (2,4-D, etc.) should not be used to apply insecticides, fungicides or other herbicides on susceptible horticultural crops.

Preplant Weed and Cover Crop Control

Control cover crops and emerged weeds before seeding or transplanting vegetable crops. Refer to Table 6-1. *Herbicides Available for Preplant Site Preparation*, page 75. Alternatively, a grower may choose to kill the cover crop or/and emerged weeds just before planting the vegetable crop and either till the area or leave seedbed untilled.

The **Stale Seedbed Technique** involves preparing a seedbed early in the growing season, and controlling emerged weeds several weeks later with glyphosate, GRAMOXONE, REGLONE or IGNITE. Seeding or transplanting vegetable crops is done, trying to disturb the soil as little as possible, to delay the emergence of a new crop of weeds. This allows the crop to establish well before the next flush of weeds.

Inter-row weeding with a contact herbicide such as paraquat (3–5.5 L/ha (1.2–2.2 L/ac) (product) in 250–1,000 L/ha (100–400 L/ac) water) can be used as a rescue operation where other methods of weed control have failed. The herbicide is directed between the crop rows onto the emerged weeds. Use special low pressure (7–15 kPa) applicators such as dribble bars or vibra jets equipped with shields to prevent wetting the crop. This technique of weeding with paraquat is registered for use on beans, beets, carrots, cole crops, cucumbers, lettuce, onions, potatoes, sweet corn and tomatoes. See *Stale Seedbed and Inter-Row Weeding*, page 91.

Preplanting (PP) Treatments

Preplanting treatments are applied before the crop is sown or planted. Some of these herbicides kill seedlings soon after germination while others also kill weed seeds. Most herbicides used for these treatments must be thoroughly incorporated in the soil by cultivation soon after application. Check the label.

Selective Preemergence (PRE or PPI) Herbicides

These materials prevent emergence of many weed seedlings without reducing crop stand. Apply immediately after seeding or at least before the emergence of the crop. If these materials are applied after weeds have emerged, kill is usually poor. Best results are obtained with this method when conditions for weed seed germination are good.

Selective Postemergence (POST) Herbicides

These chemicals are applied after the crop plants have sprouted, or after the crop has been transplanted. Applied as directed, the weeds can be killed without injury to the crop. The weeds should be small for best results.

Notes: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

ASPARAGUS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Before Emergence of Direct Seeded Asparagus – Postemergence Grass and Broadleaf Herbicides

GRAMOXONE (200 g/L) followed by DEVIRINOL DF (50 DF)	3 to 5.5 L/ha 4.5 to 9 kg/ha	1.2 to 2.2 L/ac 1.8 to 3.6 kg/ac	<ul style="list-style-type: none"> • Apply in 300–1100 L/ha (120–440 L/ac) water. • Spray GRAMOXONE as a "chemical mower" to kill emerged seedling weeds before the first asparagus seedlings are beginning to emerge. • Apply DEVIRINOL as a separate application just before a second flush of weeds emerge.
paraquat followed by napropamide	0.6 to 1.1 kg/ha 2.25 to 4.5 kg/ha		
IGNITE (150 g/L)	2.7 to 5 L/ha	1.08 to 2 L/ac	
glufosinate ammonium	0.405 to 0.75 kg/ha		<ul style="list-style-type: none"> • Apply in 110–330 L/ha (44–132 L/ac) water. • Spray uniformly on emerged weeds prior to emergence of the crop. • Weeds that have not emerged will not be controlled.
SINBAR (80 WP)	0.38 kg/ha	0.15 kg/ac	<ul style="list-style-type: none"> • PRE – Apply as a broadcast treatment within 2 days of seeding. • Plant asparagus seed to a depth of 4 cm in coarse (sandy) soils, or 2.5 cm deep in fine (clay) soils into newly cultivated fields.
terbacil	0.3 kg/ha		

Direct Seeded Asparagus – Postemergence Grass Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

POAST ULTRA (450 g/L) plus MERGE	0.32 to 1.1 L/ha 1 to 2 L/ha	0.13 to 0.45 L/ac 0.4 to 0.8 L/ac	<ul style="list-style-type: none"> • Apply to actively growing grasses. • For annual grass, use 0.32 L/ha. Apply at the 1–6 leaf stage (2–5 is optimum). • For volunteer grains, use 0.47 L/ha. Apply at the 1–6 leaf stage (2–5 is optimum). • For quackgrass, use 1.1 L/ha. Apply up to the 3-leaf stage. Thorough preplant tillage will ensure more uniform quackgrass emergence. Cultivate after 7 days in wide row crops. Use the high rate of MERGE for quackgrass. • Use 100–200 L water/ha (40–80 L water/ac). • Grasses emerging after application will not be controlled. • Spray tips angled forward 45° will give better coverage. • Do NOT use flood jet or hollow cone nozzles. • Do NOT apply if rain is expected within one hour after application. • Preharvest interval is 40 days.
sethoxydim plus surfactant/solvent	0.15 to 0.5 kg/ha 1 to 2 L/ha

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

BEANS (LIMA AND SNAP) – SEE CHAPTER 7, BEANS, PAGE 85.

BEETS (SUGAR) – SEE SUGAR BEETS (PROCESSING), ON PAGE 246.

BEETS (RED)

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall.

Beets (Red) – Soil Applied Broadleaf Herbicides

PYRAMIN FL (430 g/L) 8.25 to 10.25 L/ha 3.3 to 4.1 L/ac

pyrazon 3.54 to 4.4 kg/ha

- PRE – Apply in 150–300 L/ha (60–120 L/ac) water.
- **Do NOT** use on soils less than 3% organic matter.
- Rainfall or irrigation is required to activate herbicide.

Beets (Red) – Postemergence Broadleaf Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

CELERY

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Celery – Postemergence Broadleaf Herbicides

AIM EC (240 g/L)

- **Hooded Application ONLY**, refer to Chapter 6, page 80 for precautions and rates.
- **Do NOT** apply closer than 1 day to harvest.

Celery – Postemergence Grass and Broadleaf Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

GESAGARD 480 SC (480 g/L)

3.75 to 4.58 L/ha

1.5 to 1.83 L/ac

prometryne

1.8 to 2.2 kg/ha

- **Do NOT** apply until 21 days after transplanting crop when the celery plants are established.
- Apply in 200–1000 L/ha (80–400 L/ac) water in the transplanted crop.
- **Do NOT** use on direct seeded crop.
- Preharvest interval is 54 days.

LOROX L (480 g/L)

1.87 to 4.68 L/ha

0.75 to 1.87 L/ac

linuron

0.9 to 2.25 kg/ha

- Apply 8–10 days after transplanting.
- Apply at a rate of 1.9 to 2.5 L/ha on loam or clay soil with low organic matter.
- Apply at a rate of 2.5 to 4.7 L/ha on muck or clay soil with medium organic matter.
- Apply in 150–300 L/ha (60–120 L/ac) water in the transplanted crop.
- Some yellowing of the leaves may be noticed but this will be temporary.

mineral oil (herbicidal)

overall spray

600 to 800 L/ha

240 to 320 L/ac

rows only undiluted

300 to 400 L/ha

120 to 160 L/ac

- Apply as the true leaves develop on the celery, before weeds are 10 cm high.
- Use **ONLY** on outdoor seedbed and **ONLY** if the soil is moist.

CORN (SWEET) – SEE CHAPTER 9, CORN, FIELD AND SWEET, PAGE 109.

CHICORY

Chicory (root chicory, Ontario only) – Postemergence Broadleaf Herbicides

AIM EC (240 g/L)

- **Hooded Application ONLY**, refer to Chapter 6, page 80 for precautions and rates.
- **Do NOT** apply closer than 1 day to harvest.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

HERBS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes.

Herbs – Soil Applied Grass and Broadleaf Herbicides

DEVIRINOL DF (50 DF)	1.12 to 2.24 kg/ha	0.45 to 0.9 kg/ac	<ul style="list-style-type: none"> • PRE or PPI – Use on basil ONLY. • Apply in 200–900 L/ha (80–360 L/ac) water. • ONLY one application per year. • Do NOT plant non-labeled crops until 12 months after application to avoid injury. • High rates may result in temporary crop stunting or retardation. However, crops will outgrow the injury and yield is unaffected.
napropamide	0.56 to 1.12 kg/ha		
SINBAR (80 WP)	1.75 kg/ha	0.7 kg/ac	<ul style="list-style-type: none"> • PRE – Use on peppermint and spearmint ONLY. • Apply once per crop season at the end of September to early October. • Do NOT apply closer than 9 or 10 months to harvest. • Do NOT use on soils with less than 1% OM.
terbacil	1.4 kg/ha		

Herbs – Postemergence Grass Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

POAST ULTRA (450 g/L) plus MERGE	0.32 to 0.65 L/ha 1 to 2 L/ha	0.13 to 0.19 L/ac 0.4 to 0.8 L/ac	<ul style="list-style-type: none"> • Use on spearmint and peppermint ONLY. • Apply to actively growing grasses. • For annual grass, use 0.32 L/ha. Apply at the 1–6 leaf stage. • For volunteer grains, use 0.47 L/ha. • For quackgrass suppression, use 0.65 L/ha. Apply up to the 3-leaf stage. Thorough preplant tillage will ensure more uniform quackgrass emergence. Cultivate after 7 days in wide row crops. Use the high rate of MERGE for quackgrass. • Apply using 110–200 L/ha (44–80 L/ac) water. • Do NOT apply closer than 30 days to harvest.
sethoxydim plus surfactant/solvent	0.15 to 0.2 kg/ha 1 to 2 L/ha

LEEKS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

Leeks – Postemergence Broadleaf Herbicides

AIM EC (240 g/L)

- **Hooded Application ONLY**, refer to Chapter 6, page 80 for precautions and rates.
- **Do NOT** apply closer than 1 day to harvest.

Leeks – Postemergence Grass and Broadleaf Herbicides

GESAGARD 480 SC (480 g/L) 3.75 L/ha 1.5 L/ac

prometryne 1.8 kg/ha

- Apply 2 applications 10 days apart, before weeds are 5 cm high.
- Make the first application to well-established transplanted leeks that have produced one new fully expanded leaf.
- Can be used on either muck or mineral soils.
- **Do NOT** use more than 2 applications a year.
- Temporary injury can occur to the lower leaves in some cultivars of leek.

LETTUCE

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

Lettuce – Soil Applied Grass and Broadleaf Herbicides

CIPC EC (480 g/L) 9.36 to 14 L/ha 3.74 to 5.6 L/ac

chlorpropham 4.5 to 6.75 kg/ha

KERB (50 WP) 4.4 to 9 kg/ha 1.76 to 3.6 kg/ac

propyzamide 2.2 to 4.5 kg/ha

- PRE.
- When overhead irrigation is used at seeding time, delay application until after first irrigation but before crop emergence.
- Use lower rates in cool, wet weather to avoid injury and delay in emergence.
- Use lower rates in mineral soils.
- For direct seeded lettuce, apply PPI, PRE, or POST after the crop emerges to weed-free soil.
- For transplanted lettuce, apply 7–10 days after transplanting to weed-free soil.
- Use only once per year.
- **Do NOT** replant lettuce in KERB-treated fields in the same year.
- **Do NOT** use on muck soils.
- **Do NOT** apply closer than 55 days to harvest.

Lettuce – Postemergence Broadleaf Herbicides

AIM EC (240 g/L)

- **Hooded Application ONLY**, refer to Chapter 6, page 80 for precautions and rates.
- **Do NOT** apply closer than 1 day to harvest.

PEPPERS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

All treatments should be applied in 150–300 L/ha (60–120 L/ac) water. Discussion of cultural methods can be found in the tomato section. Weed control in peppers is best accomplished by combining chemical and cultural methods.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

Peppers – Soil Applied Grass Herbicides

sethoxydim plus surfactant/solvent	0.15 to 0.5 kg/ha 1 to 2 L/ha		

Peppers – Inter-Row Weeding with AIM EC – See Chapter 6, page 78 for precautions and rates.

AIM EC (240 g/L)	<ul style="list-style-type: none"> • Hooded Application ONLY, refer to Chapter 6, page 80 for precautions and rates. • Do NOT apply closer than 1 day to harvest.
------------------	---

POTATOES

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

The best weed management system for potato uses a combination of chemical weed control with cultivation and other techniques. See Chapter 1, *Principles Of Integrated Weed Management*, page 1. Cultivation prior to potato emergence using various kinds of cultivation equipment (light harrows, finger weeder, hillers, etc.) will control the early flush of weeds. Root pruning of the crop should be minimized. If the crop is hilled after application of herbicides, untreated soil will surface and another flush of weeds may result.

POTATO VINE KILLING – For information on products and rates of application of vine killing, consult OMAFRA Publication 363, *Vegetable Production Recommendations*, and follow the product label.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
Potatoes – Soil Applied Grass Herbicides

------------------	--

SUGAR BEETS (PROCESSING)

Caution about Herbicide Residues – Sugar beets are one of the most sensitive crops to herbicide residues from the previous year's crop. They are particularly sensitive to residues from many of the Group 2 herbicides, including PURSUIT, BROADSTRIKE, CLASSIC and PEAK. Low soil pH (below 6.0) or high soil pH (above 7.5) can be a factor to delay the breakdown of these herbicides, increasing crop injury in rotational crops. Please see Table 4-3. *Herbicide Crop Rotation and Soil pH Restrictions*, on page 72, as well as product labels and your herbicide and sugar company representatives for more details on your situation.

--	--	--------------------------	---

TOMATOES (TRANSPLANTED)

Weed control in tomatoes usually consists of a combination of chemical weed control and cultivation. Crop rotation is also beneficial in the control of weeds. Cultivation should be shallow to prevent bringing untreated soil to the surface, which may result in another flush of weeds. When tomatoes are grown on raised beds and beds are reshaped during the course of the season, it may be necessary or useful to apply another herbicide treatment to areas between the rows to prevent a new weed infestation from interfering with harvesting. Do not exceed the total recommended rate per season of any herbicide applied more than once per year. Band treatment of herbicides over the row will reduce the cost by one-half to two-thirds depending on the width of the band compared to the row spacing. Shallow inter-row cultivation will be required for weed control between the rows.

Perennial weeds may be partially controlled by cultivation. Controlling them in crops other than tomatoes when grown in rotation is the best approach to perennial weed control. Perennials are easily spread with cultivators or tillage equipment. Till areas of perennial weeds last. Machinery sanitation is important when moving from between fields.

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

Tomatoes (Transplanted) – Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.25 to 1.75 L/ha	0.5 to 0.7 L/ac	<ul style="list-style-type: none"> • Apply PPI. Incorporate shallowly to maintain spatial separation between herbicide treated zone and developing tomato roots. • Use ONLY on transplant tomatoes grown for processing. • Do NOT use on muck, peat, high organic matter soils. • Do NOT use on soils with less than 1% organic matter. • Use the higher rate for heavier weed populations, Eastern black nightshade and yellow nut sedge.
s-metolachlor/benoxacor	1.14 to 1.6 kg/ha

Berry Crops

14. BERRY CROPS

CULTURAL WEED CONTROL IN BERRY CROPS

A successful weed control program must integrate cultural and chemical weed control practices. Growers cannot depend entirely on chemical weed control in berry crops, since there is a limited spectrum of herbicides registered for these crops.

Perennial Weed Control

It is important to identify and control perennial weeds in the preplanting year. It is very difficult to control perennial weeds once a planting is established because of crop sensitivity to some herbicides and since it is not possible to clean cultivate in established berry crops.

The following perennial weeds present serious problems in these crops: quackgrass, bindweed, vetch, wild grape, perennial nightshade, thistles, ground-ivy (creeping charlie) and burdock. In strawberries, sheep sorrel, toad flax and milkweed also present problems.

Systemic herbicides such as glyphosate (e.g. ROUNDUP) or amitrole (e.g. AMITROL, 240) should be applied to perennial weeds in the preplanting year. Consult the product label and be sure to use the recommended rate for the weed in question. Apply the herbicide at the proper stage of growth of the weed, otherwise only temporary control will be achieved. Repeated cultivation of some perennial weeds such as bindweed will also provide control.

Site Preparation

A green manure crop such as perennial ryegrass or Sudan grass should be established in the preplanting year following or in conjunction with measures to control perennial weeds. This crop will provide competition to reduce weed growth as well as improving the soil structure. Non-selective herbicides can be applied before planting the green manure crop and before plowing it under. Short residual selective herbicides such as 2,4-D may be used with the green manure crop, but avoid using herbicides that leave a soil residue that will carry over into the planting year.

Mulching

For bramble and bush fruit, biodegradable plastic mulch could be used for weed control in the planting strip. Straw mulch will also assist in weed control beneath the plants or in the planting strip if it is applied early in the season before the weed seeds germinate. Use mulch that is free of weed seeds and ensure that enough nitrogen is provided for the plants. The mulch should be pulled away from around the plants for winter rodent protection.

For strawberries, use of straw mulch before weeds germinate can help control weeds. Some growers are trying plasticulture as a way to improve weed control.

Reducing Weed Pressure

Cultivation can provide weed control between the rows. In bramble and bush fruit, a vigorous sod between the rows will prevent weeds from becoming established. It is better to seed in a fescue sod than to rely on a natural sod composed of weed and grass species, since the weeds will seed into the herbicide strip.

Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weeds that escape before they set seed, by cultural removal or chemical mowing. In some situations, tools such as a weed whip may be of use. Mowers are available which will cut close to the plants without injury. Mowing, however, will not eliminate weed competition.

Rotating Herbicide Families

(See Table 4-5, *Herbicide Groupings for Ontario*, page 6-4).

In perennial crops, rotation of herbicide families is important to minimize the building up of seed from weed escapes, including triazine tolerant weeds. Rotation will also help avoid an accumulation of herbicide residues in the soil that may result in crop injury over a period of years and may hinder replanting.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

BLUEBERRIES, Highbush

CULTURAL WEED CONTROL – see previous page.

Mulching: Biodegradable mulch could be used for weed control within the plant row. Sawdust mulch will assist in weed control if it is applied early in the season before the weed seeds germinate. Apply old sawdust 5 cm thick. The mulch will not prevent the germination of weed seeds that may blow onto the surface of the mulch.

In subsequent years, the organic matter in the mulch may tie up and thus reduce the effectiveness of certain residual herbicides.

The nitrogen requirements of the crop will change as the mulch is degraded. Initially nitrogen will be consumed by micro-organisms, thus necessitating higher rates of nitrogen fertilizer. Later, as the sawdust is degrading, nitrogen will be released and the crop may require less nitrogen fertilizer than an unmulched crop. It may take 2 years or more for sawdust mulch to significantly decompose. Adjust fertilizer rates according to mulch breakdown, plant growth and leaf nutrient analysis results.

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Recommended rates /ha or /ac refer to area actually treated with herbicide.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

CAUTION – Simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of the planting.

Blueberries (Highbush) – Year of Planting (Soil Applied Grass and Broadleaf Herbicides)

DEVRINOL DF (50 DF)	9 L/ha	3.6 L/ac	<ul style="list-style-type: none">• PRE – Apply once per season, either in the fall or spring, before weeds emerge.• Incorporation by rainfall or irrigation is essential.• Do NOT apply to frozen ground.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

CRANBERRIES

Maintaining a healthy and vigorous crop will aid in weed control by avoiding openings in the bed for weed germination and establishment.

Prevent weeds from setting seed on dikes and in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from setting seed. Seeding the dikes with a desirable grass cover will reduce the opportunities for weed establishment and will provide bank stabilization.

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

PREEMERGENCE – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments.

Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

Cranberries – Soil Applied Grass and Broadleaf Herbicides

CASORON 4G (4 Gr)	110 kg/ha	44 kg/ac	<ul style="list-style-type: none">• PRE – For annual broadleaf weeds, certain sedges and <i>Juncus</i> species.• Apply in early spring prebloom.• Temporary reddening of plants may occur, especially with late spring applications.• Do NOT use on new plantings, or on newly sanded beds.• Do NOT use on beds recently mowed for vines.
dichlobenil	4.4 kg/ha		
DEVIRINOL 10G (10%)	45 to 67 kg/ha	18 to 26.8 kg/ac	<ul style="list-style-type: none">• PRE – Apply once per year in spring and irrigate immediately.• Do NOT use on new beds.
napropamide	4.5 to 6.7 kg/ha		

Cranberries – Postemergence Grass Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

POAST ULTRA (450 g/L)	0.32 to 1.1 L/ha	0.13 to 0.45 L/ac	<ul style="list-style-type: none">• Apply to actively growing grasses.• For annual grass, use 0.32 L/ha. Apply at the 1–6 leaf stage (2–5 is optimum).• For volunteer grains, use 0.47 L/ha. Apply at the 1–6 leaf stage (2–5 is optimum).• For quackgrass, use 1.1 L/ha. Apply up to the 3-leaf stage. Thorough preplant tillage will ensure more uniform quackgrass emergence. Use the high rate of MERGE for quackgrass.• Use 100–200 L water/ha (40–80 L water/ac).• Grasses emerging after application will not be controlled.• Spray tips angled forward 45° will give better coverage.• Do NOT use flood jet or hollow cone nozzles.• Do NOT apply if rain is expected within one hour after application.• Do NOT apply closer than 15 days to harvest.

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

15. TREE FRUIT & GRAPES

CULTURAL WEED CONTROL IN FRUIT CROPS

A successful weed control program must integrate cultural and chemical weed control practices. Growers cannot depend entirely on chemical weed control in fruit crops, since there is a limited spectrum of herbicides registered for these crops.

Perennial Weed Control

It is important to identify and control perennial weeds in the preplanting year. It is very difficult to control perennial weeds once a planting is established because of crop sensitivity to some herbicides and since it is not possible to clean cultivate in established orchards, vineyards, berry crops and nurseries.

The following perennial weeds present serious problems in these crops; quackgrass, bindweed, vetch, wild grape, perennial nightshade, thistles, ground ivy (creeping charlie) and burdock. In strawberries, sheep sorrel, toadflax and milkweed also present problems.

Systemic herbicides such as glyphosate (e.g. ROUNDUP) or amitrole (e.g. AMITROL 240) should be applied to perennial weeds in the preplanting year. Consult the product label and be sure to use the recommended rate for the weed in question. Apply the herbicide at the proper stage of growth of the weed, otherwise only temporary control will be achieved. Repeated cultivations of some perennial weeds such as bindweed will also provide control.

Site Preparation

A green manure crop such as perennial rye-grass or Sudan grass should be established in the preplanting year following or in conjunction with measures to control perennial weeds. This crop will provide competition to reduce weed growth as well as improving the soil structure. Non-selective herbicides can be applied before planting the green manure crop and before plowing it under. Short residual selective herbicides such as 2,4-D may be used with the green manure crop, but avoid using herbicides that leave a soil residue that will carry over into the planting year. See Chapter 6, *Preplant-Site Preparation Prior To Any Crop*, page 78.

Mulching

A biodegradable plastic mulch could be used for weed control in the planting strip. A straw mulch will also assist in weed control beneath the trees or in the planting strip if it is applied early in the season before the weed seeds germinate. Use mulch that is free of weed seeds and ensure that enough nitrogen is provided for the plants. The mulch should be pulled away from around the tree bases for winter rodent protection. Peastone gravel is another option that can be applied around the base of the trees. It will provide weed control as well as improving drainage, encouraging deeper rooting and discouraging rodents.

Reducing Weed Pressure

Cultivation can provide weed control between the rows. Alternatively, a vigorous sod between the rows will prevent weeds from becoming established. It is better to seed in a fescue sod than to rely on a natural sod composed of weed and grass species, since the weeds will seed into the herbicide strip.

Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weeds that escape before they set seed, by cultural removal or chemical mowing. In some situations, tools such as a weed whip may be of use. Mowers are available which will cut close to the trees without injury. Mowing, however, will not eliminate weed competition.

Rotating Herbicide Families

(See Table 4-5, *Herbicide Groupings for Ontario*, page 64).

In perennial crops, rotation of herbicide families is important to minimize the building up of seed from weed escapes, including triazine tolerant weeds. Rotation will also help avoid an accumulation of herbicide residues in the soil that may result in crop injury over a period of years and may hinder replanting.

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g., too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

APPLES

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Recommended rates /ha or /ac refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

CAUTION – Simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.

Apples – Year of Planting (Soil Applied Grass and Broadleaf Herbicides)

CASORON 4G (4 Gr)	110 to 175 kg/ha	44 to 70 kg/ac	<ul style="list-style-type: none"> • PRE – Apply to cool, moist soil in spring before weeds emerge or after cultivation. • Do NOT apply if air temps are above 10–15°C to avoid injury from volatilization. • Do NOT apply until 4 weeks after transplanting. • Do NOT use on light sandy soils. • 70 g of CASORON 4G applied to an area 2×2 m is equivalent to 175 kg/ha (70 kg/ac).
dichlobenil	4.4 to 7 kg/ha		
DEVRINOL DF (50 DF)	9 kg/ha	3.6 kg/ac	<ul style="list-style-type: none"> • PRE – Apply after planting trees, but before weeds emerge. • Use a directed spray at low pressure. • Incorporation by rainfall or irrigation is essential within 2 days of application.

TREFLAN EC (480 g/L)	1.25 to 2.4 L/ha	0.5 to 0.96 L/ac	<ul style="list-style-type: none"> • PPI – Apply and incorporate before planting trees. • Apply once in the planting year ONLY. • Use at least 100 L/ha water (40 L/ac).
or BONANZA 400 (400 g/L)	1.5 to 2.75 L/ha	0.6 to 1.1 L/ac	
<i>trifluralin</i>	0.6 to 1.155 kg/ha		

Apples – Year of Planting (Postemergent Grass Herbicides)

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

POAST ULTRA (450 g/L) plus MERGE	0.32 to 1.1 L/ha 1 to 2 L/ha	0.13 to 0.45 L/ac 0.4 to 0.8 L/ac	<ul style="list-style-type: none">• Apply to actively growing grasses.• For annual grass, use 0.32 L/ha. Apply at the 1–6 leaf stage.• For volunteer grains, use 0.47 L/ha.• For quackgrass, use 1.1 L/ha. Apply up to the 3-leaf stage.• Do NOT apply closer than 25 days to harvest.
sethoxydim plus surfactant/solvent	0.15 to 0.5 kg/ha 1 to 2 L/ha		
VENTURE L (125 g/L)	0.6 to 2 L/ha	0.24 to 0.8 L/ac	<ul style="list-style-type: none">• Apply POST to actively growing grasses before tillering.• Apply at 0.6 L/ha (0.24 L/ac) at 2–5 leaf stage of volunteer corn.• Apply at 0.8 L/ha (0.32 L/ac) at 2–5 leaf stage of volunteer wheat and barley.• Apply at 1 L/ha (0.4 L/ac) at 2–5 leaf stage of annual grasses (2–4 leaf for foxtails).• Apply at 2 L/ha (0.8 L/ac) at 3–5 leaf stage of quackgrass and wirestem muhly.• Do NOT apply more than once per year.• Grasses emerging after the treatment will not be controlled.
fluazifop-p-butyl	0.075 to 0.25 kg/ha

simazine plus glyphosate	2 to 4.5 kg/ha 0.8 to 4.27 kg/ha		

APRICOTS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Recommended rates /ha or /ac refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

CAUTION – Simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.

linuron	4.5 kg/ha		

GRAPES

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Cultural Weed Control – See *Cultural Weed Control in Fruit Crops*, page 279.

Hilling the vines at regular intervals throughout the year will aid in weed control. Be aware that this disruption of the soil will also disturb any residual herbicides.

The use of cultivation, mulch or rye cover crops between the rows will provide better water penetration as well as aid in weed control.

Grapes – Year of Planting and 2nd Year Non-bearing Grapevines (Soil Applied Grass Herbicides)

Cultivation after planting is needed to level the soil, and early establishment on trellises or staked will minimize damage from cultivation. Hilling for winter protection can be started in late summer, and will control late germinating weeds. Removing of hills each spring will also aid in weed control.

Recommended rates /ha or /ac refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

CAUTION – Simazine, KARMEX, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of vineyard.

FRONTIER (900 g/L)	1.4 L/ha	0.56 L/ac	<ul style="list-style-type: none"> PRE —rainfall is required within 10 days of application to achieve sufficient herbicide activation. Do NOT apply by air. Do NOT harvest within 2 years of application on first year grapes. Do NOT harvest within one year of application on 2nd year grapes. Apply to weed-free soil, after planting or dehilling.
dimethenamid	1.26 kg/ha		

Established Grapevines (Soil Applied Grass and Broadleaf Herbicides)

CASORON 4G (4 Gr)	110 to 225 kg/ha	44 to 90 kg/ac	<ul style="list-style-type: none"> PRE – Apply to cool moist but unfrozen soil in late fall or spring before weeds emerge. Do NOT apply if air temps are above 10–15°C to avoid injury from volatilization. Apply to dormant healthy vines ONLY. Do NOT apply to vines until they have been established for at least 2 full years. For annual weeds, use 110–175 kg/ha (44–70 kg/ac). For quackgrass, and broadleaf perennial weeds, use 175–225 kg/ha (70–90 kg/ac).

glufosinate ammonium plus simazine	0.405 to 0.75 kg/ha 3.6 to 4.5 kg/ha		

PEACHES

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 78.

Recommended rates /ha or /ac refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

PREPLANT INCORPORATED (PPI) —Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Pay attention to machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

CAUTION – Simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.

Peaches – Year of Planting (Soil Applied Grass and Broadleaf Herbicides)

CASORON 4G (4 Gr)	110 to 175 kg/ha	44 to 70 kg/ac	<ul style="list-style-type: none"> PRE – Apply to cool, moist soil in spring before weeds emerge or after cultivation. Do NOT apply if air temperatures are above 10–15°C to avoid injury from volatilization. Do NOT apply until 4 weeks after transplanting. Do NOT use on light sandy soils. 70 g of CASORON 4G applied to an area 2×2 m is equivalent to 175 kg/ha (70 kg/ac).
dichlobenil	4.4 to 7 kg/ha		
DEVRINOL DF (50 DF) PRINCEP NINE-T (90 WG)	7 kg/ha 2.25 kg/ha	2.8 kg/ac 0.9 kg/ac	<ul style="list-style-type: none"> PRE – Apply in the fall through early spring before weeds emerge. Do NOT apply on frozen ground or during harvest. Make ONLY one application in the planting year. Incorporation by rainfall or irrigation is essential within 2 days of application.

linuron	4.5 kg/ha		

16. NURSERY & ORNAMENTAL CROPS

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

HERBACEOUS ORNAMENTALS

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 75.

To convert kg/ha or L/ha to g/ha or mL/100 m² – Multiply by 10 and change units to 100 m².

Example 11 kg/ha becomes 110 g/100 m²
 28.4 L/ha becomes 284 mL/100 m².

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

WARNING – Certain species may be injured by the following herbicides. Check manufacturer's directions for labeled species before use.

Herbaceous Ornamentals – Soil Applied Grass and Broadleaf Herbicides

DACTHAL W-75 (75 WP)	17 kg/ha	6.8 kg/ac	<ul style="list-style-type: none"> • Apply at lining out, late fall or early spring in 340 L of water. • Applications should be made to soil recently cultivated to a uniform texture. • Rain or irrigation (1 cm) is needed to activate this herbicide. • Do NOT use on Germander, Telanthera, Ajuga, Mesembryanthemum, Dianthus, Viola Phlox and Vinca minor.
chlorthal dimethyl	12.75 kg/ha		
CIPC EC (480 g/L) or CIPC (20 Gr)	11.6 L/ha 27.5 kg/ha	4.64 L/ac 11 kg/ac	<ul style="list-style-type: none"> • PRE – May be applied either PRE or POST to crop. • Particularly effective against purslane. • Apply after a clean cultivation, when the soil is moist, in 200–400 L/ha (80–160 L/ac) water.
chlorpropham	5.577 kg/ha		
TREFLAN EC(480 g/L) or RIVAL EC (500 g/L) or BONANZA 400 (400 g/L)	1.25 to 2.4 L/ha 1.2 to 2.2 L/ha 1.5 to 2.75 L/ha	0.5 to 0.96 L/ac 0.48 to 0.94 L/ac 0.6 to 1.1 L/ac	<ul style="list-style-type: none"> • PPI – must be incorporated before transplanting. • Do NOT use for seeded annuals. • Check label for list of tolerant species. • Check label for application rate as it varies with soil type.
trifluralin	0.6 to 1.155 kg/ha		

TRADE NAME (Formulation) active ingredient	PRODUCT RATE PER HA active rate per ha	RATE PRODUCT PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
--	--	--------------------------	---

Herbaceous Ornamentals – Postemergent Grass Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

VENTURE L (125 g/L)	0.6 to 2 L/ha	0.24 to 0.8 L/ac	<ul style="list-style-type: none"> For <i>Campanula</i> and <i>Sedum</i> – direct spray ONLY to avoid contact with crop. Apply POST to actively growing grasses before tillering. Apply at 0.6 L/ha (0.24 L/ac) at 2–5 leaf stage of volunteer corn. Apply at 0.8 L/ha (0.32 L/ac) at 2–5 leaf stage of volunteer wheat and barley. Apply at 1 L/ha (0.4 L/ac) at 2–5 leaf stage of annual grasses (2–4 leaf for foxtails). Apply at 2 L/ha (0.8 L/ac) at 3–5 leaf stage of quackgrass & wirestem muhly. Thorough preplant tillage, fragmenting quackgrass rhizomes improves control. Many species are tolerant in field production only. (Consult the label for list of tolerant species.)
fluzifop-p-butyl	0.075 to 0.25 kg/ha		

Herbaceous Ornamentals – Postemergent Grass and Broadleaf Herbicides

CIPC EC (480 g/L)	11.6 L/ha	4.64 L/ac	<ul style="list-style-type: none"> Apply as a directed spray or use the granular formulation. Particularly effective against purslane. Apply after a clean cultivation, when the soil is moist, in 200–400 L/ha (80–160 L/ac) water.
or CIPC (20 Gr)	27.5 kg/ha	11 kg/ac

Established Shelterbelts and Windbreaks – Postemergent Grass Herbicides

POSTEMERGENCE – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

VENTURE L (125 g/L)	0.6 to 2 L/ha	0.24 to 0.8 L/ac	<ul style="list-style-type: none"> • Apply POST to actively growing grasses before tillering. • Apply at 0.6 L/ha (0.24 L/ac) at 2-5 leaf stage of volunteer corn. • Apply at 0.8 L/ha (0.32 L/ac) at 2-5 leaf stage of volunteer wheat and barley. • Apply at 1 L/ha (0.4 L/ac) at 2-5 leaf stage of annual grasses (2-4 leaf for foxtails). • Apply at 2 L/ha (0.8 L/ac) at 3-5 leaf stage of quackgrass & wirestem muhly. • Thorough preplant tillage, fragmenting quackgrass rhizomes improves control. • Do NOT cultivate between rows until 5 days after application.
<i>fluazifop-p-butyl</i>	0.075 to 0.25 kg/ha		

Established Shelterbelts and Windbreaks – Postemergent Grass and Broadleaf Herbicides

glyphosate (360 g/L)	0.75 to 12 L/ha	0.3 to 4.8 L/ac	<ul style="list-style-type: none"> • For actively growing weeds in the fall, or spring prior to emergence of any crop. • Allow 5-7 days translocation time after application before doing any tillage when conditions are good. If cool temperatures follow application, allow additional time for translocation to be completed before disturbing treated weeds. • Only weeds emerged at application time will be controlled. Additional weed control programs will be necessary to control weeds germinating later. • Repeat application to regrowth may be necessary for complete control. • For specific information on product rates and notes for annual and perennial weed control refer to Table 4-2, page 59.

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

WOODY NURSERY STOCK – FIELD GROWN NURSERY STOCK

Cultural Weed Control – See *Cultural Weed Control in Fruit Crops*, page 279.

Mechanical weed control such as cultivation and hand hoeing will provide weed control in sensitive species as well as provide control of weed escapes. Cultivators are available which will work in between trees and in the row.

Site Preparation Before Planting – See Chapter 6, *Special Methods of Weed Control*, page 75.

PREPLANT INCORPORATED (PPI) – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

WARNING – Refer to manufacturers' instructions for waiting period required after planting.

WARNING – Certain types of woody nursery stock may be injured by the following herbicides. Check manufacturer's directions for labeled species/cultivars before use.

Woody Nursery Stock (Field Grown) – Soil Applied Grass Herbicides

KERB (50 WP)	3 kg/ha	1.2 kg/ac	<ul style="list-style-type: none"> • PRE – Apply in the late fall when the soil temperature is low but above freezing. • Soil moisture should be high. • This herbicide is absorbed through the roots.
propyzamide	1.5 kg/ha		
DUAL II MAGNUM (915 g/L)	1.25 to 1.75 L/ha	0.5 to 0.7 L/ac	<ul style="list-style-type: none"> • PRE – Apply in at least 150 L of water. • Apply to soil prior to bud break of nursery stock. • Do NOT apply within 4 weeks of bud burst or until the needles have hardened. • For use on white spruce, Norway spruce, black spruce, white pine, Jack pine and red pine seedlings in their second year or older. • Also for use on poplar stoolbeds. • May have postemergent properties if applied to weeds before they reach the 2 leaf stage.
s-metolachlor/benoxacor	1.14 to 1.6 kg/ha		

Woody Nursery Stock (Field Grown) – Soil Applied Broadleaf Herbicides

GALLERY (75 DF)	1 kg/ha	0.4 kg/ac	<ul style="list-style-type: none"> • PRE – For use in bareroot and container conifer seedlings. • Applied prior to weed emergence in conifers, four or more weeks after crop germination and emergence. • Rainfall or irrigation is needed to activate the herbicide.

Woody Nursery Stock – Container Beds

CULTURAL WEED CONTROL – A successful weed control program must integrate cultural and chemical weed control practices.

Prepare the container bed area with a gravel layer and/or ground covers such as black plastic or opaque woven material. It is important that these surface covers exclude light in order to be effective in preventing weed seed germination. These ground covers can be used for a number of years before being replaced.

Keep the container beds and roadways free of weeds by physical removal or chemical mowing. Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weed escapes before they set seed by cultural removal or chemical mowing. In some situations, such as along fences, tools such as a weed whip may be useful. Look for the source of weeds that disseminate into container areas such as poplars, willows, willowherb and Canada fleabane.

Control weeds around irrigation ponds so that small seeded weeds are not being sown into container stock with each watering. A vigorous grassed bank will help reduce weed infestations as well as providing bank stabilization. A filtering system in the irrigation line will remove weed seeds.

Removal of existing weeds from container stock before they flower **must be a priority job**. Once a weed flowers it can disseminate hundreds of seeds by wind or by catapulting seeds. Many container weed species have several generations per year because their seeds do not need to overwinter before germinating. Remove and discard all pulled weeds well away from the growing area so that seeds are not disseminated into nearby containers.

Since many species of container weeds overwinter in the protected environment of a polyhouse, it is important to thoroughly weed container stock in the fall. Be sure to remove the rosettes of winter annuals such as shepherd's-purse and Canada fleabane and established plants and seedlings of common and mouse-eared chickweed. If not removed, these plants will be flowering by May or earlier.

PREEMERGENCE (PRE) – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

WARNING – Refer to manufacturers' instructions for waiting period required after planting.

WARNING – Certain types of woody nursery stock may be injured by the following herbicides. Check manufacturer's directions for labeled species/cultivars before use.

28.4 L/ha becomes 284 mL/100 m²

Driveways, Patios And Paths – Postemergent Grass and Broadleaf Herbicides

ECOCLEAR (25%)	1 L/3 L of water or 1L/2.5 L of water		<ul style="list-style-type: none"> • Apply to young, actively growing weeds when temperatures are above 15°C. • Complete coverage is necessary to achieve control. • Use the low rate for annual weeds that are small (3 to 5 leaf). • Ude the high rate for larger annual weeds and perennial weeds. • Weeds that are near maturity, flowering, dormant or hardened due to drought or temperature stress are more tolerant to ECOCLEAR treatments and may not be adequately controlled with a single application. • A repeat application is effective for extended control of perennial weeds following initial burn down. • Avoid application to reactive metals.
Acetic acid	(33% to 40% solution)		

SEEDBEDS AND POTTING SOIL

To convert kg/ha or L/ha to g/ha or mL/100 m²: Multiply by 10 and change units to 100 m².

Example – 11 kg/ha becomes 110 g/100 m²
28.4 L/ha becomes 284 mL/100 m²

Seedbeds and Potting Soil – Soil Applied Fumigants

BASAMID (98 Gr)	510 kg/ha	204 kg/ac	<ul style="list-style-type: none"> • Do NOT use below 6°C. • Refer to manufacturer's directions for specific details as well as direction on sealing soil, evacuating gases and performing the safety germination test.
dazomet	500 kg/ha		
TERR-O-GAS 67 (67 Li)			<ul style="list-style-type: none"> • A poisonous gas which must be applied under a gas proof cover (usually plastic). • It's use is subject to the <i>Pesticides Act</i>. • It may be used by the grower on his own seedbeds but he must obtain a permit from the Ontario Ministry of the Environment each time it is used. • See Appendix D, page 368. • The manufacturer's instructions must be followed, and the seedbed or greenhouse aired thoroughly after the treatment period. • If there is any question, review the safety precautions in the <i>Pesticides Act</i>, or refer to OMAFRA's resource centre or the Ministry of the Environment. See Appendix D, page 368.
methyl bromide/ chloropicrin			
VAPAM (380 g/L)	10 L/100 m ² in 800 L water		<ul style="list-style-type: none"> • Apply as a drench to a soil that should be wet to a depth of at least 8 cm. • Do NOT plant for 10–14 days or longer if the weather is cool.
metam sodium	3.8 kg/100 m ²		

17. TURFGRASS (LAWNS, PARKS, GOLF COURSES & SOD FARMS)

To convert kg/ha or L/ha to g/100 m² or mL/100 m² – Multiply by 10 and change units.

For example – 11 kg/ha becomes 110 g/100 m²
28.4 L/ha becomes 284 mL/100 m²

MANAGING WEEDS IN TURFGRASS

The major species of broadleaf weeds infesting lawns in Ontario are dandelion, plantain, black medick, chickweed, prostrate knotweed, mallow, henbit, ground-ivy, and white clover. The major grassy weeds are crabgrass, annual bluegrass, quackgrass, orchard grass and bentgrass.

CULTURAL PRACTICES TO MANAGE WEEDS IN TURFGRASS

The easiest, cheapest and most effortless way to keep lawns free of weeds is to encourage vigorous growth of turfgrass. Most weeds cannot compete in a dense, healthy turf. Growth practices that encourage vigorous grass growth discourage weed infestations. Such practices include proper irrigation and drainage, use of fertilizers, insect and disease control, and the use of the correct type of turfgrass for the situation.

Mowing stimulates bud development and tillering, inducing the sod to become thick and dense. Cut commonly grown grasses such as the fescues, bluegrasses and turf-type perennial ryegrasses to a height of 4–6 cm. Invasion by weeds may occur, if grasses are cut shorter than 4 cm.

Avoid scalping the turf when cutting around trees and flowerbeds. Do not remove more than one-third of the leaf area when mowing. Mowing too frequently may reduce the carbohydrate reserves of the turf, thereby reducing its competitiveness. Mowing can also be used to remove annual weeds and eliminate seed production, reducing or preventing the spread of weeds.

Fertilizer is particularly important in establishing a thick, dense and healthy turf sward. Too few nutrients applied to the turf will lead to increased susceptibility to disease and insects. If this happens, the root system of the turf will not develop and the grass will not be able to withstand traffic or recover from injury. Too much fertilizer may lead to soft, weak grass that is prone to disease damage.

Watering is critical during periods of drought that may injure, kill or induce dormancy in the turf, thereby allowing weeds to become established. Irrigate weekly, using 3 cm of water per application to help produce deep-rooted turf.

Frequent light sprinkling will have the opposite effect on the grass roots. Light water applications encourage the germination and growth of shallow rooted species such as crabgrass and creeping bentgrass. Too much irrigation water will lead to infestation by yellow nut sedge and annual bluegrass. Remember to provide adequate watering near trees and hedges because they compete for available moisture.

Drainage is important to ensure that waterlogging does not occur, so install adequate drainage if needed.

Compaction should be avoided to prevent invasion by weeds that thrive in compacted soil. Knotweed and annual bluegrass often invade turfgrass where compaction, caused by excessive traffic, is a problem. While aeration practices do help, the best answer is to modify the area to reduce traffic. Immediate resodding or reseeding of damaged areas discourage weed infestations.

Select **turfgrass species** to match the growth conditions. For example, fescues are tolerant to low-light intensity in shaded areas under trees, whereas turf-type perennial ryegrass varieties are quick to establish in newly seeded areas and will crowd out germinating weeds. Kentucky bluegrass, although slow to establish, is very competitive once established.

Mechanical removal of weeds can be very effective, provided weed populations are not too high. Weeds can be removed by hand pulling, with a knife or V-shaped spudding tool.

CHEMICAL WEED CONTROL

Chemical weed control is often the easiest, most effective and cheapest way to control annual and perennial weeds when populations are very high.

New Turf

After seeding new turf, many annual weeds may emerge before the grass seedlings are up. If these young weeds are not controlled, they will shade and eventually crowd out much of the grass population. Mowing at a height of 6–8 cm will eliminate many such weeds. If they are extremely thick, 2,4-D at $\frac{1}{2}$ the usual concentration

(0.4–0.6 kg in 800 L water/ha) or mecoprop-P (0.4–0.6 kg in 400 L water/ha) can be used – but not before the grass had been up at least 4 weeks.

Established Turf

Applications of 2,4-D are most effective in the spring, or in September when the weeds are growing well. This treatment generally thins clover in the lawns. Weeds not normally controlled by 2,4-D may be controlled by mecoprop-P, and dicamba, or with combinations of these 3 herbicides. Mecoprop-P and dicamba are also sold in commercial mixtures with 2,4-D. See Table 18-2, *Classification of Weeds According to Response to Various Foliage Sprays*, page 354, for information on the response of common weeds to various herbicides. Thorough wetting of the weed foliage is emphasized.

Do NOT use mixtures containing dicamba close to shrubs, or other susceptible ornamentals, at rates above

0.425 kg/ha (active). Prepared mixtures of this chemical and 2,4-D are effective on a wide range of lawn weed species, including knotweed, which is not controlled by most other herbicides except when very young.

Broadleaf Herbicides

- 2,4-D will control many broadleaf weeds including dandelion, lamb's-quarters, mustards, peppergrass, pigweeds, plantains, shepherd's purse, smartweeds, vetch.
- Mecoprop-P will control many 2,4-D and MCPA tolerant weeds such as chickweeds, clovers, ground ivy and black medick, and is generally safer to use on bentgrass than 2,4-D.
- Dicamba will control broadleaf weeds including 2,4-D tolerant weeds such as chickweeds, clover

and young knotweed but will not adequately control plantain.

- MCPA will control field horsetail, dandelion, lamb's-quarters, mustards, plantains, shepherd's purse, and wild carrot. Weeds tolerant to MCPA include chickweeds, clovers and black medick. Two and three way mixes of these herbicides extend the spectrum of weeds that are controlled by using only one of these herbicides.

Grass Herbicides

- BETASAN and DIMENSION can be applied before crabgrass emerges in the spring, and ACCLAIM SUPER and DIMENSION can be applied after emergence.

NOTES: Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90%–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	RATE PRODUCT PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
LAWNS, PARKS, GOLF COURSES AND SOD FARMS			

Site Preparation Before Turfgrass Establishment

Apply in 200–300 L/ha (80–120 L/ac) water.

glyphosate (360 g/L)*	0.75 to 12 L/ha	0.3 to 4.8 L/ac	<ul style="list-style-type: none"> Glyphosate is a non-selective herbicide that will kill turf that is sprayed. For actively growing weeds in the fall, or spring prior to planting (otherwise turf will be killed). Allow 5–7 days translocation time after application before doing any tillage when conditions are good. If cool temperatures follow application, allow additional time for translocation to be completed before disturbing treated weeds. Only weeds emerged at application time will be controlled. Additional weed control programs will be necessary to control weeds germinating later. Repeat application to regrowth may be necessary for complete control. For specific information on product rate and notes for annual and perennial weed control, refer to Table 4-2, page 59.
or glyphosate (480 g/L)*	0.56 to 9 L/ha	0.22 to 3.6 L/ac	
or glyphosate (500 g/L)*	0.54 to 8.64 L/ha	0.22 to 3.5 L/ac	
or glyphosate (540 g/L)*	0.5 to 8 L/ha	0.2 to 3.2 L/ac	
glyphosate*	0.27 to 4.32 kg/ha		

Turfgrass – Preemergence Grass Herbicides

Apply in 800–1000 L/ha (320–400 L/ac) water, unless otherwise stated.

BETASAN (480 g/L)	23 to 30 L/ha	9.2 to 12 L/ac	<ul style="list-style-type: none"> PRE – Apply to established turf before crabgrass emergence in early spring, or in fall. Use the low rate for crabgrass and the high rate for annual bluegrass. Do NOT reseed the area for 1 year following treatment. Do NOT apply peatmoss to lawn before application. Use ONLY on mineral soils.
or BETASAN (GR) (12.5 Gr)	125 kg/ha	50 kg/ac	
bensulide	11 to 14.4 kg/ha		
DACTHAL W-75 (75 WP)	15.5 kg/ha	6.2 kg/ac	<ul style="list-style-type: none"> PRE – Apply early in spring before weed seed germination. Apply in 450–1,100 L/ha (180–440 L/ac) water. Do NOT apply to Cohansey and Toronto bent. Do NOT re-seed for 60 days after application.
chlorthal dimethyl	11.625 kg/ha		
DIMENSION (120 g/L)	3.5 L/ha	1.4 L/ac	
dithiopyr	0.42 kg/ha		<ul style="list-style-type: none"> PRE – Apply in established turf before crabgrass emergence. See POST application below. Apply in 200–800 L/ha (80–160 L/ac) water. Allow turf to recover from aeration, or other stresses before application. Do NOT apply to putting greens during the first year of establishment. Check label for sensitive varieties, including Colonial bentgrasses. Do NOT irrigate within 2 hours of application. Do NOT reseed for 3 months after application. May be tank-mixed with KILLEX or other broadleaf herbicides. Do NOT tank-mix with other products for application to putting greens.

* See Table 4-1. *Herbicides Used in Ontario*, page 21, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	RATE PRODUCT PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
Turfgrass – Premergence Grass Herbicide. Inhibitors of smooth crabgrass and dandelion seed germination			
NUTRITE PRE-EMERGENT, CRABGRASS WEED SEED GERMINATION INHIBITOR (100% corn gluten meal)	980 kg/ha or 9.8 kg/100 m ²	392 kg/ac or 20 lbs/1000 sq. ft.	<ul style="list-style-type: none"> The product may inhibit dandelion and smooth crabgrass weed seed germination when used in conjunction with a sound lawn maintenance program. This product will not control emerged or established dandelion or smooth crabgrass. PRE – Apply to established turf twice a year: once in early spring and once in late summer or early fall to sports fields, parks, golf areas and sod farms. Apply using a rotary or small hand spreader. Spring application: two weeks before large crabgrass seed germination. Late summer or early fall: after heat stress has passed. Apply to a mature lawn where established perennial ryegrass is the predominant grass species. Do NOT apply on newly seeded grass, wait until after first mowing. Do NOT apply under windy conditions. Do NOT apply in the spring if overseeding or resodding in the spring. Do NOT apply in the fall if overseeding or resodding in the fall. Do NOT apply if allergic to corn.
<i>corn gluten meal</i>			
TURFMAIZE PRE-EMERGENT WEED SEED GERMINATION INHIBITOR (98% corn gluten meal)	970 kg/ha or 9.7 kg/100 m ²	970 kg/ha or 9.7 kg/100 m ²	<ul style="list-style-type: none"> The product may inhibit dandelion and smooth crabgrass weed seed germination when used in conjunction with a sound lawn maintenance program. This product will not control emerged or established dandelion or smooth crabgrass. PRE – Apply to Kentucky bluegrass turf twice a year: once in the early spring and once in the late summer/early fall. Apply using a rotary or small hand spreader. Spring application: apply to established Kentucky bluegrass turf in early spring before smooth crabgrass and dandelion seed germination. Late summer/early fall: apply to established Kentucky bluegrass turf in late summer or early fall after heat stress has passed. Apply when soil is moist and rain is forecasted within 2 days of treatment. If rainfall does not occur within 2 days of treatment, irrigation is required. Excessive moisture at time of treatment may reduce the effectiveness. Do NOT apply on newly seeded grass, wait until after first mowing. Do NOT apply in the spring if overseeding or resodding in the spring. Do NOT apply in the fall if overseeding or resodding in the fall. Do NOT apply if allergic to corn.
<i>corn gluten meal</i>

--	--	--------------------------	---

Turfgrass – Postemergence Grass Herbicides

Apply in 400–800 L/ha (160–320 L/ac) water.

ACCLAIM SUPER (80.5 g/L)	1.14 L/ha	0.46 L/ac	<ul style="list-style-type: none"> • POST – For the control of crabgrass at the 1–4 leaf up to the multi-tiller stage. • Good coverage is essential to control multi-tillered or grassy weeds in the reproductive phase. • Make a second application on mature monostands 21 days after first application. • Do NOT apply to bentgrass or seedling Kentucky bluegrass. • Do NOT tank-mix with any other herbicide or pesticide. • Do NOT apply broadleaf herbicides 7 days before or after ACCLAIM SUPER. • Do NOT apply during periods of drought stress. • Do NOT mow grass for 4 days before or after application. • Do NOT irrigate within 3 hr. after application.
fenoxaprop-p-ethyl	0.092 kg/ha		
DIMENSION (120 g/L)	3.5 to 4.5 L/ha	1.4 to 1.8 L/ac	<ul style="list-style-type: none"> • POST – For established turf until crabgrass reaches the 1–3 leaf stage before tillering; NOT recommended after 3-leaf stage. See PRE application above. • Use higher rate for larger plants or when area is heavily infested. • Apply in 200–800 L/ha (80–160 L/ac) water. • Allow turf to recover from aeration, or other stresses before application. • Do NOT apply to putting greens during the first year of establishment. • Check label for sensitive varieties, including Colonial bentgrasses. • Do NOT irrigate within 2 hours of application. • Do NOT reseed for 3 months after application. • May be tank-mixed with KILLEX or other broadleaf herbicides • Do NOT tank-mix with other products for application to putting greens.
dithiopyr	0.42 to 0.54 kg/ha		

Turfgrass – Postemergence Broadleaf Herbicides

Apply in 200–400 L/ha (80–160 L/ac) water. Avoid contact with ornamentals and flowers. Avoid applying during hot, dry weather. **DO NOT** irrigate, rake, and/or mow until at least 24 hours after application. **DO NOT** apply to newly seeded lawns until after second mowing.

2,4-D (470 g/L)* or 2,4-D (564 g/L)* or 2,4-D (660 g/L)*	1.7 to 3 L/ha 1.42 to 2.48 L/ha 1.2 to 2.1 L/ha	0.68 to 1.2 L/ac 0.57 to 1 L/ac 0.48 to 0.84 L/ac	<ul style="list-style-type: none"> • To control many broadleaf weeds including dandelion, lamb's-quarters, mustards, peppergrass, pigweeds, plantains, shepherd's purse, smartweeds, and vetch. • Damage may occur when applied to bentgrass. • If used on bentgrass apply at 0.28 kg/ha. Some yellowing of bentgrass may occur.
2,4-D *	0.8 to 1.4 kg/ha		
2,4-D/dicamba/mecoprop-P (308 g/L)*	5.5 L/ha	2.2 L/ac	<ul style="list-style-type: none"> • To control 2,4-D and MCPA tolerant weeds such as chickweeds, clovers, ground ivy and black medick as well as many broadleaf weeds including dandelion, lamb's-quarters, mustards, peppergrass, pigweeds, plantains, shepherd's purse, smartweeds, and vetch. • In closely mowed bentgrass (greens) apply at half doses (30 mL/100 m²). • Temporary yellowing of bentgrass may occur. • Recovery from injury will occur 1 week after application • See precautions for VANQUISH, below.
2,4-D/ dicamba/ mecoprop-P*	1.7 kg/ha		

* See Table 4-1. Herbicides Used in Ontario, page 21, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	RATE PRODUCT PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
2,4-D (470 g/L)* or 2,4-D (564 g/L)* or 2,4-D (660 g/L)* plus MECOPROP (150 g/L)	1.81 to 2.34 L/ha 1.51 to 1.95 L/ha 1.29 to 1.67 L/ha 5.67 to 7.34 L/ha	0.72 to 0.93 L/ac 0.6 to 0.78 L/ac 0.52 to 0.67 L/ac 2.27 to 2.93 L/ac	<ul style="list-style-type: none"> May be combined with VANQUISH (0.21 L/ha (0.08 L/ac)) for control of young knotweed. Damage may occur when applied to bentgrass. For newly established turf at least 4 weeks old, use 2,4-D at ½ the usual concentration (0.4–0.6 kg in 800 L water/ha) or mecoprop-P (0.4–0.6 kg in 400 L water/ha) for annual weeds.
2,4-D * plus mecoprop-P	0.85 to 1.1 kg/ha 0.85 to 1.1 kg/ha		
BASAGRAN (480 g/L) plus ASSIST	1.75 L/ha 2 L/ha	0.7 L/ac 0.8 L/ac	<ul style="list-style-type: none"> To control top growth of yellow nut sedge. Apply when nut sedge is young and actively growing. Make 2 applications 10 days apart. Do NOT mow grass 3–5 days before and after application. Do NOT treat newly seeded turf until well established.
bentazon plus oil concentrate	0.84 kg/ha		
COMPITOX (150 g/L) or MECOPROP (150 g/L) mecoprop-P	5.5 to 8.5 L/ha 0.83 to 1.28 kg/ha	2.2 to 3.4 L/ac	<ul style="list-style-type: none"> To control 2,4-D and MCPA tolerant weeds such as chickweeds, clovers, ground ivy and black medick, as well as many broadleaf weeds. May be applied to bentgrass. Apply before flower to dandelion. Repeated applications may be needed for dandelion and black medick.
IPCO PREMIUM 2-WAY XP TURF HERBICIDE ((1:1) 400 g/L) mecoprop-P/2,4-D	5 L/ha 2 kg/ha	2 L/ha	<ul style="list-style-type: none"> May be combined with VANQUISH (0.21 L/ha (0.08 L/ac)) for control of young knotweed. Damage may occur when applied to bentgrass. For newly established turf at least 4 weeks old, use 2,4-D at ½ the usual concentration (0.4–0.6 kg in 800 L water/ha) or mecoprop (0.4–0.6 kg in 400 L water/ha) for annual weeds.
MCPA AMINE (500 g/L)* MCPA*	2.2 to 2.8 L/ha 1.1 to 1.4 kg/ha	0.88 to 1.12 L/ac	<ul style="list-style-type: none"> For control of field horsetail, dandelion, lamb's-quarters, mustards, plantains, shepherd's purse, and wild carrot. Do NOT apply to bentgrass unless necessary, and then only at 0.28 kg/ha. Some yellowing of bentgrass may occur. Use as a substitute for 2,4-D. At slightly higher doses than 2,4-D it will usually provide as good weed control as 2,4-D. Reduced control of dandelion and plantain may occur during dry, hot weather.
MECOTURF PLUS 2,4-D ((1:1) 400 g/L) mecoprop-P/2,4-D	4.25 to 5.5 L/ha 1.7 to 2.2 kg/ha	1.7 to 2.2 L/ac	<ul style="list-style-type: none"> May be combined with VANQUISH (0.21 L/ha (0.08 L/ac)) for control of young knotweed. Damage may occur when applied to bentgrass. For newly established turf at least 4 weeks old, use 2,4-D at ½ the usual concentration (0.4–0.6 kg in 800 L water/ha) or mecoprop-P (0.4–0.6 kg in 400 L water/ha) for annual weeds.

* See Table 4-1. Herbicides Used in Ontario, page 21, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	RATE PRODUCT PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
SARRITOR	40 to 60 g/m ²		<ul style="list-style-type: none"> For suppression of dandelion and other broadleaf weeds. Apply when daytime high temperatures are 18–24°C and rainfall occurs within 12 hours of application. Use higher rate when environmental conditions are sub-optimal or when dandelion pressure is high. Do NOT mow for 3 days after application. Do NOT allow SARRITOR to come in contact with non-target, desirable plant species as severe damage may occur.
<i>Sclerotinia minor</i> (strain IMI 344141)			
VANQUISH (480 g/L)	1.25 L/ha	0.5 L/ac	<ul style="list-style-type: none"> Do NOT apply to bentgrass. Do NOT apply near shallow rooted perennials to avoid root uptake and injury. To control broadleaf weeds including 2,4-D tolerant weeds such as chickweeds, clover and young knotweed, but will not adequately control plantain. VANQUISH alone is recommended for use in certain situations only; it is best when mixed at low use rates with phenoxy herbicides. Prepared mixtures of VANQUISH and 2,4-D are effective on a wide range of lawn weed species, including knotweed, which is not controlled by most other herbicides except when very young. Do NOT use mixtures containing VANQUISH close to shrubs, or other susceptible ornamentals, at rates above 0.425 kg/ha (active). Do NOT mow grass 3–5 days before and after application. Do NOT treat newly seeded turf until well established.
<i>dicamba</i>	0.6 kg/ha		

Turfgrass Renovation

Mow and thoroughly rake the turf to be renovated to remove all dead and cut vegetation.

glyphosate (360 g/L)*	4.75 to 7 L/ha	1.9 to 2.8 L/ac	<ul style="list-style-type: none"> Apply in 200–300 L/ha (80–120 L/ac) water after omitting at least 1 regular mowing.
or glyphosate (480 g/L)*	3.54 to 5.2 L/ha	1.42 to 2.1 L/ha	<ul style="list-style-type: none"> Ideally delay tillage 7 days after application to allow for proper translocation into underground plant parts.
or glyphosate (500 g/L)*	3.4 to 5 L/ha	1.36 to 2 L/ha	<ul style="list-style-type: none"> Direct seeding into the killed turf (no tillage) may be carried out.
or glyphosate (540 g/L)*	3.15 to 4.6 L/ha	1.26 to 1.84 L/ha	
glyphosate*	1.7 to 2.5 kg/ha		

* See Table 4-1. *Herbicides Used in Ontario*, page 21, for formulations available. See label for specific uses and rates.

18. ROADSIDES & NON-CROP AREAS

ROADSIDES, RIGHTS-OF-WAY, FENCEROWS AND NON-CROP AREAS

Fencerows and Farm Areas

In agricultural areas, weeds growing in fencerows, around buildings and on roadsides are sources of potential weed infestation to other parts of a farm. In addition, brush and weeds around fields harbor insects, diseases and other pests that may be detrimental to farming operations. Shrubs like wild cherry may be possible sources of livestock poisoning.

Farmers may also wish to reclaim land on which willows or brush have encroached. It is important to keep drainage ditches and farm ponds free of troublesome aquatic vegetation.

Roadsides, Rights-of-Way and Waste Places

Road maintenance personnel are interested in controlling weeds and brush to reduce the cost of winter snow removal programs. Low vegetation will also give the road user clear view of other vehicles, animals, children and other hazards. It is important to prevent brush encroachment onto the roadway proper, to keep the drainage ditches open to prevent flooding and to minimize the fire hazard of tall, dry vegetation in the late summer. A grass cover also prevents soil erosion much better than weeds.

Both railway and power supply authorities are concerned with maintaining safe and accessible rights-of-way by controlling growth of weeds and brush.

In certain areas (beneath guide rails, in storage yards, under railway tracks and under fences at road intersections), it may be advantageous to completely kill all vegetation for a longer period of time. Herbicides and suggestions for their use in this way can be found in *Vegetation Control – Long Term Non-selective*, page 349.

In roadside and right-of-way spraying, for weed control or brush control, precautions should always be taken to minimize herbicide drift. It is advisable to inspect or monitor each roadside just prior to spraying to locate susceptible crops, water crossings and other sensitive areas. Appropriate "shut off" and "turn on" points should be marked so these areas can be avoided during the actual spray operation.

BRUSH CONTROL

There are several techniques that may be used for the chemical control of deciduous woody species: stem foliage sprays, basal bark sprays and frilling or spot treatments.

The choice of technique will depend on such factors as brush type, accessibility, availability of equipment, proximity to susceptible crops or ornamental vegetation and the size of the control program.

Stem Foliage Treatments Applied to "Runoff" – Most deciduous woody species

Stem foliage treatment of brush should be limited to smaller growth (less than 2 m in height). Treatments should be applied to thoroughly wet the stems and foliage to the point of runoff. This technique is most effective just after full leaf development in late spring or early summer.

The choice of herbicides for controlling stands of deciduous brush should be based on the susceptibilities of the predominant species (Table 18-1. *Susceptibility of Woody Plants to Various Herbicides & Mixtures as Foliage Sprays*, on page 352) or whether the brush to be controlled is near homes, recreational areas, etc.

Basal-Bark Treatments in Oil as a Carrier

The BASAL-BARK treatment is useful on a wide range of trees and brush with a trunk diameter up to about 15 cm. Apply the chemical so as to thoroughly cover the basal 30 cm of the trunk and any exposed roots. For oak, hickory, basswood or ash, treatments are most effective from February to June. Most other species may be treated at any season of the year.

Light, simple equipment, coupled with the possibility of winter operations when labor is cheaper and access to swampy areas possible, give this treatment an important role in a brush control program.

Stump Treatment After Cutting to Most Deciduous Woody Species

In many cases, it is more desirable to remove existing brush by hand than to spray it and leave the dead material standing. Chemical stump treatment is particularly useful in preventing the vigorous regrowth that is the characteristic response of many deciduous species after cutting. Moreover killing the stump is the first step towards encouraging it to rot.

Most treatments must be applied to freshly cut stumps to achieve maximum effectiveness. For old stumps, it is best to drill several holes or to split stump with a wedge before applying the treatments. Spray regrowth from an old stump along with the stump. Various dye materials may be added to the oil based sprays to assure that all exposed surfaces of the stumps are treated.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

GENERAL TREATMENTS FOR WOODY SPECIES

Single or scattered trees or shrubs may be controlled efficiently with dry applications of sodium borate or chlorate mixtures. Apply the chemical in a band at the base of the plant, following the manufacturer's directions.

Basal (Spot) Treatment

On stands of deciduous or coniferous brush that range from light to scattered, use individual spot treatment with bromacil (HYVAR X-L). It may be applied with an exact delivery hand gun. Apply undiluted at 10 g/m of height (5 cm diameter) or brush or dilute 1 HYVAR X-L with 5 L of water and apply 60 g/m of height of brush. Taller and larger brush requires progressively more herbicide.

Sucker Growth Control After Pruning

Many trees sprout prolifically after they have been pruned. The application of fortified tree wound dressings to the surface of the cuts can reduce the number of new sprouts from many tree species.

These paints improve natural inhibition achieved through the use of poor trimming practice. All pruning should be done to strong laterals. Severe pruning should be avoided. Best results will be obtained if the materials are applied to the cuts between April 15–July 15. Treatment of all cuts is important, as each is a potential location for sprouting from both dormant and adventitious buds. Cover the entire cut and about 2 cm of the surrounding bark, especially below the cut. Heavy tree wound dressing will adversely affect the rate of callus formulation of some species.

Tree Injection

Glyphosate as a 0.15 g EZJECT capsule can be used to control woody brush and trees with an EZJECT capsule injection system. Capsules must penetrate through the outer bark and into the inner living tissue to provide effective results. Capsules should be spaced evenly around the tree, below all major branches at a rate of 1 capsule per 5 cm sem diameter at breast height (dbh). Stems should be in excess of 3 cm dbh but usually not in excess of 20 cm dbh. Trees should not be frozen at time of treatment. Allow 1–2 years for complete control.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

PERENNIAL WEED CONTROL (NON-CROP LAND)

CAUTION: Unless otherwise recommended, do not use these treatments in crop situations. Avoid using if the chemical is likely to wash or leach into areas occupied by the roots of desirable trees or other plants. Follow all precautions to avoid spray drift onto non target vegetation.

The use of atrazine, simazine, bromacil, or diuron non selectively, as described, is generally limited by cost to the handling of small patches of perennial weeds. The chemical either leaches down to the weed root system or makes the surface soil toxic for a period of time varying from a few months to several years, depending on the chemical, rate of application and soil type. Generally, crops cannot be grown successfully until the effect of the chemical has disappeared. Corn, however, can be grown safely when high rates of simazine and atrazine are applied.

Some perennial weeds, such as field bindweed, horsetail, goldenrod, milkweed and bracken fern, are difficult to eradicate at the lower rates of diuron, simazine, atrazine and bromacil. Follow the manufacturer's directions carefully if the area is to be re-seeded. The amitrole treatment is of value in spot treating patches of quackgrass in a field that is not entirely infested.

While the tops of many perennial weeds may be controlled by doses of 2,4-D that may be selectively used in resistant crops, heavier doses, as described, must be used if eradication is to be attempted. Several applications upon successive stages of regrowth will probably be necessary. Generally, treatments with 2,4-D during rapid development of the weed at about the early bud to flowering stages of growth are most effective. Apply spray to thoroughly wet all foliage.

Heavier doses of 2,4-D on patches of weeds may be applied during normal selective spraying operations merely by slowing down the sprayer speed in the infested areas. Expect local crop damage where this is done.

Perennial weeds are more difficult to control than annual weeds because regrowth occurs rapidly from underground parts after the top growth is removed by chemical or mechanical means. In non crop land they pose a special problem because cultivation cannot be used for their control. Chemicals must kill the root system as well as the above ground parts to give effective perennial weed control.

Postemergence Grass Herbicides

POISON-IVY CONTROL

Several chemicals have been shown to be effective for the control of poison-ivy. However, some growth may occur after treatment with any of these chemicals and retreatments will be necessary to achieve eradication. The chemical treatment of poison-ivy must take into account the location in which the weed is growing. If desirable shrubs or trees are present, avoid soil sterilants and use the other materials with caution.

A 9–14 L sprayer is the most convenient method of applying herbicides to patches of poison-ivy. Thorough coverage of the leaves with the spray is essential for maximum effect. After spraying, leave the area alone until the plants die, at which time gather and bury the dead stems. Even at this stage poisoning may be brought about by handling the dead plant. All treatments are most effective when the poison-ivy is in full leaf and growing actively, from about June 15–July 31.

Postemergence

REDUCTION OF HERBICIDAL DRIFT

In the application of herbicides, especially of the hormone type (2,4-D, mecoprop, dichlorprop, dicamba, etc.) sensitive crops (grapes, tomatoes, turnips, tobacco, beans, carrots, beets, fruit trees, ornamental plants and many others) beyond the area being sprayed can be damaged by vapor or spray drift.

To reduce the danger of herbicidal drift:

1. Use only amine formulations when it is necessary to apply phenoxy herbicides (2,4-D, mecoprop, dichlorprop, etc.) near sensitive, non-target plants.
2. Very slight spray drift with herbicides containing dicamba can be more damaging to soybeans and other crops than equivalent amounts of 2,4-D spray drift. There is also a possibility of dicamba vapor drift from treated plant foliage during high temperatures (in excess of 25°C); thus, use of dicamba containing herbicides should be avoided near sensitive, desirable plants.

3. Use the lowest pressure possible to apply the herbicide. This may mean the use of a dribble bar, Radiarc boom, vibrajel nozzle, Directa-spra nozzle, flood jet or more conventional nozzle tips.
4. Manufacturer's recommendations regarding nozzle spacing and height should be carefully followed. It may be necessary to mount nozzles on skids to keep them at a constant distance from the surface to be sprayed.
5. For roadside spraying various spray additives are available which may reduce spray drift by increasing the viscosity or density of the spray. These materials should be used following manufacturer's directions and observing normal precautions (vehicle speed, wind velocity, proximity to sensitive crops, etc.)

WARNING: These methods and materials can reduce but not eliminate herbicidal drift. In areas near sensitive crops, all normal precautions must be taken. It should be emphasized that extremely low, even invisible, amounts of spray drift can be very damaging to sensitive crops. In some cases, do not spray during the growing season.

ROADSIDE WEED CONTROL

The main objectives of a weed control program for roadsides are: (1) to control tall growing weeds so that mowing costs can be minimized; (2) to control weeds that may infest adjacent land by wind dispersal of seed; (3) to maintain an attractive grass cover that will minimize erosion problems; (4) to prevent buildup of excessive vegetation that can become a fire hazard in the late summer or complicate snow removal in winter; and most importantly, (5) to ensure highway safety.

Most broadleaf weeds are susceptible to early summer applications of 2,4-D and related herbicides (See Table 18-2. *Classification of Weeds According to Response to Various Foliage Sprays*, page 354). However, many weeds are not effectively controlled by 2,4-D mixtures and these resistant weeds can become an increasing problem unless other herbicides are used. It may be justified using spot treatments with non selective chemicals that may temporarily injure the grass to control isolated, but dense, patches of difficult weeds before they spread and become a problem over a large area.

* See Table 4-1, *Herbicides Used in Ontario*, page 21, for formulations available. See label for specific uses and rates.

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

VEGETATION CONTROL - LONG TERM NON-SELECTIVE

CAUTION: These chemicals should not be used to treat areas that are close to gardens, desirable trees, etc. Since these chemicals are non-selective (will kill any plant that they contact), special care must be used in their application. If the area (for example, a driveway) is higher than a nearby lawn, the chemical may wash onto the lawn with the first rain. If trees or shrubs are feeding under the treated areas, the chemical may leach to their roots and cause injury.

It may be desirable to maintain certain areas completely free of vegetation. Usually two problems are involved. First, the existing vegetation must be destroyed, including the destruction of underground stems and roots of perennials. Second, the bare area thus produced must be maintained either by persistent soil active chemicals or by foliage treatment of weed seedlings.

Some chemicals will kill existing vegetation. Others, while excellent for maintaining the bare area, may be used more economically if combined with another chemical to kill existing growth. If a mixed population of weeds is present, combinations of chemicals that will kill the different weed types may be used advantageously.

Uniform coverage with all chemicals is essential. Touch up operations should be expected, as a single treatment will seldom give complete eradication. Usually 2 applications of the lower recommended rate (i.e., 5.5–11 kg/ha), depending on the chemical used, spaced 6–12 months apart, give better results than a single application of the higher recommended rate. This approach also reduces the risk of off-site movement.

Bare Areas – Non selective control of all vegetation

ARSENAL (240 g/L)	3 L/ha	1.2 L/ac	• Apply in sufficient water (100 to 550 L/ha (40 to 220 L/ac)) to wet all foliage during periods of active growth.

--	--	--------------------------	---

VEGETATION CONTROL - SHORT TERM NON-SELECTIVE

Foliage Treatment Chemical Mowing

Chemicals offer an alternative to mowing in areas where top kill of low growing vegetation is desired. The chemicals listed below are first applied when the growth is about 15 cm high. Spray to runoff. Tall vegetation is more difficult to kill and can become an unsightly fire hazard when it dies.

AMITROL 240 (231 g/L)	16.5 L/ha	6.6 L/ac	<ul style="list-style-type: none"> • Apply to actively growing foliage to be effective. • Apply in sufficient water (200–400 L/ha (80–160 L/ac)) to thoroughly wet all foliage. • With AMITROL 240, newly formed leaves turn white before the plants die. The appearance of foliage injury may be delayed during cool conditions. • Regrowth may occur from freshly germinating plants or from underground portions of perennial weeds. (Also see <i>Wiper Applicators for Selective Weed Control</i>, page 9).
or glyphosate (360 g/L)*	5 to 7 L/ha	2 to 2.8 L/ac

PRECAUTIONS

(For more information, see Chapter 4, page 21 and Chapter 5, page 67).

WEED CONTROL IN DITCHES

When ditches on roadsides, or in other locations, contain standing or moving water, do not apply herbicides to emergent weeds without consulting the Ontario Ministry of the Environment regarding the need for a permit (see *Water Weeds*, page 357). However, such permits are not normally necessary to apply herbicides to control weeds adjacent to ditches or weeds in ditches when no water is present.

Take the following precautions:

- Spray when ditch or stream contains no flowing water.
- Avoid spraying directly onto water surface (violates *Pesticides Act*, *Water Resources Act*).
- Schedule spray programs so that extensive sections of stream bank or ditch bank are not sprayed at one time.
- Work upstream rather than downstream along the stream bank or ditch bank.
- Ascertain downstream water uses to avoid possible conflict with the rights of other landowners.

Emergents

2,4-D (470 g/L)* or 2,4-D (564 g/L)* or 2,4-D (660 g/L)*	4.5 L/ac 4 L/ac 3.4 L/ac	1.8 L/ac 1.6 L/ac 1.36 L/ac	<ul style="list-style-type: none">• For bulrushes.• Apply as the low-volatile ester in 750–1,000 L/ha (300–400 L/ac) water.

19. WATER WEEDS (AQUATIC PLANTS)

WATER WEEDS

According to the *Pesticides Act* and Regulation 914 a person requires an Aquatic Vegetation exterminator's licence to use a herbicide to control aquatic plants (water extermination) and a permit to purchase and apply a herbicide into water. There are some exemptions under Regulation 914 for a license and permit requirements as noted below.

Most, aquatic herbicides are classified into Schedule 2. Persons who hold an Aquatic Vegetation exterminator's licence may purchase a Schedule 2 herbicide for aquatic plant control without a permit. However, a permit is required by the holder of an Aquatic Vegetation licence to use aquatic herbicides on someone else's property.

A person who is the owner of a property, or his or her full time employee, upon which a water body is located does not require an Aquatic Vegetation licence to use a herbicide for aquatic plant control, if the water body is:

- Wholly contained within the boundaries of that property and that has no direct or indirect outflow, other than by percolation,
- A drainage ditch located wholly within the boundaries of his or her own property that at the time of the extermination contains no flowing water.

However, a person who is the owner of a property, or his or her full-time employee, requires a permit to purchase a Schedule 2 herbicide for aquatic plant control in that water body.

Note: Certified growers are permitted to purchase and use Schedule 2, 3, 4, 5 and 6 pesticides for a land extermination only on their own farmland. The use of an aquatic herbicide is a water extermination. Therefore, a permit is required by a certified grower to purchase a Schedule 2 aquatic herbicide but not for its use.

For further information on water extermination permits, contact the Ontario Ministry of the Environment Regional Office in your area. See Appendix D, *Ontario Ministry of the Environment Regional Pesticide Offices*, page 368.

Reducing or eliminating the flow of nutrients into water bodies is an effective preventative measure to control excessive aquatic weeds. Herbicides only provide temporary control of nuisance aquatic vegetation. Alternate methods such as mechanical removal of submergent plants, dredging or substrate alteration of drainage ditches can provide longer-term control. Mechanical control measures may have an impact on fish habitat and therefore would require approval from the Ministry of Natural Resources. Management techniques for vegetation control in ponds include minimizing nutrient input, dredging excess sediment, logs

and other organic debris, decreasing the surface to depth ratio and increasing the rate of pond turnover (flushing). Some aquatic plant and algae life should be accepted and tolerated as a vital component of a healthy ecosystem.

Aquatic vegetation can vary widely; species include completely submerged plants such as Canada Waterweed and algae; free floating plants such as water lilies; and emergent plants such as cattails and bulrushes. Many emergent plants will grow equally as well on the moist shoreline as when their lower stems and roots are in water. Where these emergent species have taken possession of the shoreline, control measures must embrace that area as well as the water.

Stonewort and muskgrass are a gray green to green plant-like algae, attached to the sediment, or free floating. In dense communities this plant-like algae has a very strong musk odour. It is brittle to the touch and will dry to a white powder upon removal from the water.

Tapegrass (wild celery) is found in many recreational lakes, is resistant to all the currently recommended herbicides. It has long rubbery leaves and numerous short roots. Control is possible only by mechanical methods. Applications of herbicides over several years may be necessary for effective control of cattails and bulrushes.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HA active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS (For more information, see Chapter 4, page 21 and Chapter 5, page 67).
--	--	--------------------------	---

Algae and Vascular Submergents

(e.g., *Chara*, Canada Waterweed, Tapegrass, Coontail, Water Milfoil, Bladderwort, Pondweed)

KARMEX DF 80%	6.25 to 25 kg/ha m		<ul style="list-style-type: none"> • Apply lower rates for algae, including filamentous algae such as <i>Chara</i>, control and higher rates for Bladderwort and Pondweed. • Apply early in season to surface of water using min. 450 L/ha of water and agitate. Calculate ha m = surface area in sq. m × depth in m/10,000. • Treat only a small portion of the pond at one time to avoid oxygen depletion and fish suffocation. • Do NOT use in domestic water supplies or water bodies producing fish for human consumption. • Do NOT irrigate with treated water for one year. • Do NOT apply to ponds or irrigation ditches having desirable trees or plants on the perimeter or to areas where there roots may extend, or in locations where the herbicide may be washed or moved in contact with the roots. • Do NOT drain ponds into areas containing desirable plants. • Not effective in flowing water.
<i>diuron</i>	0.5 to 2 ppm		
POLYDEX	1.6 to 16 mL/1000L		<ul style="list-style-type: none"> • To control algae in ponds, lagoons, dugouts with no outflow. • Do NOT apply or allow discharge to lakes, flowing water or ponds with outflow. • This product is toxic to copper-sensitive aquatic plants, invertebrates and fish. • Effective application rate depends on water condition and the extent of micro-organisms present.
<i>Copper (aquatic)</i>			
REWARD (240 g/L)	18.3 to 29.2 L/ha	7.4 to 11.8 L/ac	<ul style="list-style-type: none"> • For control of Coontail, Canada Waterweed and Pondweed in still or slow-moving water of farm dugouts, farm ponds, farm ditches, lakes and canals. • Treat dense populations of Duckweed as submergent and apply as surface spray on foliage. • <i>Chara</i> (Stonewort, Musk grass) are not controlled. • Do NOT use treated water for animal consumption or swimming for at least 24 hours. • Do NOT use for human consumption or irrigation for at least 5 days. • To avoid oxygen depletion, treat only 1/4 to 1/3 of the area at a time. • Rate depends on water depth: <ul style="list-style-type: none"> – less than 1.5 m – use 18.3 L/ha (7.4 L/ac) – more than 1.5 m – use 25 to 29.2 L/ha (10.1 to 11.8 L/ac) • Apply when plants are young and growing vigorously. • Application to dense growth of mature weeds will not give satisfactory control.
<i>diquat (aquatic)</i>	4.4 to 7 kg/ha		
REWARD (240 g/L)	9.2 L/ha	3.7 L/ac	<ul style="list-style-type: none"> • For control of water milfoil in lakes. • Treat when plants are in the very early stage of growth (June). • See REWARD note above.
<i>diquat (aquatic)</i>	2.2 kg/ha

M.L. Lister-Santavy

Acid Equivalent (abbreviation – a.e.) (2,4-D, glyphosate) – the active part of the acid herbicide being used – usually indicated in grams/L on the label.

Active Ingredient – the chemical in a formulated product that is responsible for the herbicide effects.

Adjuvant – an ingredient added to a herbicide formulation or spray mixture to aid or modify the action of the herbicide, or the physical characteristics of the mixture.

Amine – acid or anionic herbicides can be formulated as ammonium salts or amines. 2,4-D amines are relatively non-volatile under most climatic conditions.

Annual Plant – completes its life cycle within a one year period. Summer annuals complete their life cycle between spring and fall. Winter annuals germinate in fall, overwinter and then flower and complete their life cycle the following spring or summer.

Band Treatment – a herbicide applied as a narrow strip over the crop row, usually followed by inter-row cultivation.

Biennial Plant – completes its life cycle within a two-year period. Germinates in the spring, overwinters, flowers the following spring or summer and dies back the following fall.

Carrier – the diluent or material added to a herbicide product to facilitate its even distribution over the target area. The carrier is often water but it may also be granular products, oil or other solvents.

Compatible – compounds or formulations that can be mixed and applied together without undesirably altering their separate effects or the physical properties of the mixture.

Contact Chemicals – chemicals that kill only the parts of the plant on which they are sprayed. Movement within the plant is minimal.

Cotyledons – the seed leaves. Often visible when large seeds are opened. These are the first leaves visible in the germinated seedling. Broad-leaved crops or weeds have two cotyledons (dicots). Grasses (monocots) have one.

Directed Treatment – a treatment directed onto the weeds or soil in such a manner as to avoid contact with the crop.

Dormant – a resting stage similar to the condition of a plant during the winter.

Emergence – the time at which the seedling first appears above the ground.

Escape – a plant in a treated area that has been missed or survived the treatment.

Ester – some acid herbicides are reacted with alcohols to produce ester formulations. Ester formulations of 2,4-D and related herbicides can vaporize under hot conditions after treatment and cause unwanted damage by moving away from the treated area.

Formulation – means the same as Product - an active ingredient processed with other materials or formulators to make it easier to apply and/or more effective. Herbicides are rarely sold as pure active ingredients (2,4-D acid), they are sold as formulated mixtures (i.e. 2,4-D amine, sodium salt or ester with added emulsifiers, adjuvants, carriers, etc.).

Half-Life – the time required for 50% of a herbicide to be degraded or inactivated in soil or water.

Herbicide – a chemical that is toxic to plants. Herbicide Tolerant Crops (abbreviation – HTC's) – New varie-

ties of crops that have been developed by classical breeding or transgenic techniques to be tolerant to specific herbicides.

Hormone-Type Herbicide – includes 2,4-D, 2,4-DB, mecoprop MCPA, MCPB, dichlorprop, dicamba and triclopyr, picloram. At extremely low concentrations, these chemicals can stimulate and/or disrupt the growth of broadleaved plants.

Non-Selective Herbicide – a chemical used in such a manner that all exposed vegetation is damaged.

Perennial Plant – lives for more than 2 years.

Product – the contents of a herbicide container as marketed. In addition to the active ingredient, it may also contain other solvents, surfactants or carriers that are referred to as inert ingredients or formulators.

Program – application of one or more herbicides at two different stages of crop and/or weed growth. The second herbicide application is used to provide control of the weeds either escaping the original herbicide treatment or that are problems at different periods in the growth of the crop.

Resistant Weeds (Herbicide Resistant Weeds) – the inherited ability of some weeds in the population of a particular weed species to survive a herbicide application to which most of the original population was susceptible.

Selective Herbicide – a chemical used in such a manner that it will kill weeds on a growing crop without damaging the crop.

Sodium Salt – some acid or anionic herbicides can be formulated as sodium salts (e.g. 2,4-D).

Soil Sterilant – a soil active herbicide that is applied at a sufficiently high rate to prevent all plant growth for at least one season.

Surfactant – a chemical added to the herbicide formulation or to the spray solution to improve the dis-

persing, spreading, sticking or wetting properties of the spray mixture.

Susceptible – a crop that may be damaged or a weed that may be readily controlled by a recommended rate of herbicide.

Tank-Mix – two chemicals that are packaged separately and mixed in the sprayer tank.

Translocated Herbicide – a chemical herbicide that moves within the plant.

Pest Diagnostic Clinic

Tel: 519-767-6256

Samples for disease diagnosis, insect or weed identification, nematodes counts and Verticillium testing can be sent to:

Pest Diagnostic Clinic
Laboratory Services Division
University of Guelph
95 Stone Rd. W.,
GUELPH, ON N1H 8J7
Telephone: 519-767-6256 Fax: 519-767-6240
E-mail: pdc@lsd.uoguelph.ca

**Payment must accompany samples
at the time of submission.**

SUBMISSION FORMS ARE AVAILABLE
AT: www.uoguelph.ca/pdc

Charges will be applied to each sample submitted.
Payment: Please make cheque payable to the University of Guelph. VISA and Mastercard are also accepted. Please do not mail cash.

Minimum Fee of \$50.

These charges may change without notice. Refer to Laboratory Services website at www.uoguelph.ca/pdc for current rates.

HOW TO SAMPLE FOR NEMATODES

Soil

When to Sample

Soil and root samples can be taken at any time of the year whenever the soil is not frozen. In Ontario nematode soil population levels are generally at their highest in May–June and again in September–October.

How to Sample Soil

Take samples with a soil sampling tube, trowel or narrow bladed shovel. Sample soil to a depth of 20–25 cm (8–10 in.). If the soil is bare, remove the top 2 cm (1 in.) prior to sampling. A sample should consist of 10 or more subsamples combined. Mix well. Then take a sample of ½ L to 1 L (1 pint to 1 quart) from this. No one sample should represent more than 2.5 ha (6.25 ac.).

Mix subsamples in a clean pail or plastic bag.

Sampling Pattern

If living crop plants are present in the sample area, take samples within the row and from the area of the feeder root zone (with trees this is the drip line).

Number of Subsamples

Based on the total area sampled

500 m ² (5,400 ft ²)	10 subsamples
500 m ² – 0.5 ha (5,400 ft ² – 1.25 ac.)	25 subsamples
0.5 ha – 2.5 ha (1.25 – 6.25 ac.)	50 subsamples

Roots

From small plants sample entire root system plus adhering soil. For large plants, 10–20 g (½–1 oz.) dig fresh weight from the feeder root zone and submit.

Problem Areas

Take soil and root samples from the margins of the problem area where the plants are still living. If possible, take both soil and root samples from problem and healthy areas in the same field.

Sample Handling

Soil Samples

Place in plastic bags as soon as possible after collecting.

Root Samples

Place in plastic bags and cover with moist soil from the sample area.

Storage

Store samples between 5°C and 10°C (40°F and 50°F) and do not expose to direct sunlight or extreme heat or cold (freezing). Only living nematodes can be counted. Accurate counts depend on proper handling of samples.

Submitting Plant for Disease Diagnosis or Identification

Sample Submission Forms

Obtain forms from your local OMAFRA office. Carefully fill in all of the categories on the form. In the space provided draw the most obvious symptom and the pattern of the disease in the field. It is important to include the cropping history of the area for the past 3 years and this year's pesticide use records.

Choose a complete, representative sample showing early symptoms. Submit as much of the plant as is practical, including the root system, or several plants showing a range of symptoms. For turfgrass, submit a 10–15 cm, square piece of turf, including thatch and at least 5 cm of soil. Take the sample from the outside edge of a ring or patch and include healthy and unhealthy turf and the interface between. If symptoms are general, collect

the sample from an area where they are of intermediate severity. **Completely dead material is usually inadequate for diagnosis.** With plant specimens submitted for identification, include a 20–25 cm sample of the top portion of the stem with lateral buds, leaves, flowers or fruits in identifiable condition. Wrap plants in newspaper and put in a plastic bag. Tie the root system off in a separate plastic bag to avoid drying out and soil contaminating the leaves. Do not add moisture, as this encourages decay in transit. Cushion specimens and pack in a sturdy box to avoid damage during shipping. Avoid leaving specimens to bake or freeze in a vehicle or in a location where they could deteriorate.

Delivery

Deliver to the Pest Diagnostic Clinic as soon as possible by first class mail or by courier at the beginning of the week.

Submitting Insect Specimens for Identification

Collecting Samples

Place dead, hard bodied insects and spiders in vials or boxes and cushioned with tissues or cotton. Put soft bodied insects and caterpillars in vials containing alcohol. Do not use water as this will result in rot. Do not tape insect to paper or send them loose in an envelope.

Place live insects in a container with enough plant "food" to support them during transit. Be sure to write "live" on the outside of the container.

Linear Measures (length)

10 millimetres (mm)	= 1 centimetre (cm)
100 centimetres (cm)	= 1 metre (m)
1,000 metres	= 1 kilometre (km)

1 inch	= 2.54 cm
1 foot	= 0.30 m
1 yard	= 0.91 m
1 mile	= 1.61 km

Area

1 square foot	= 0.09 m ²
1 square yard	= 0.84 m ²
1 acre	= 0.40 ha

Volume (dry)

1 cubic yard	= 0.76 m ³
1 bushel	= 36.37 L

Volume (liquid)

1 fluid ounce (Imp.)	= 28.41 mL
1 pint (Imp.)	= 0.57 L
1 gallon (Imp.)	= 4.55 L
1 gallon (U.S.)	= 3.79 L

Weight

1 ounce	= 28.35 g
1 pound	= 453.6 g
1 ton	= 0.91 tonne

Pressure

1 pound per square inch	= 6.90 kPa
-------------------------	------------

Temperature

$$^{\circ}\text{C} = (^{\circ}\text{F} - 32) \times 5/9$$

Abbreviations

%	= per cent (by weight)	km/h	= kilometres per hour
ai	= active ingredient	kPa	= kilopascal
AP	= agricultural powder	L	= litre
cm	= centimetre	m	= metre
cm ²	= square centimetre	m/s	= metres per second
DG	= dispersible granular	m ²	= square metre
DP	= dispersible powder	mL	= millilitre
E	= emulsifiable	mm	= millimetre
e.g.	= for example	SC	= sprayable concentrate
EC	= emulsifiable concentrate	SP	= soluble powder
F	= flowable	t	= tonne
g	= gram	W	= wettable (powder)
Gr	= granules, granular	WDG	= water dispersible granular
ha	= hectare	WP	= wettable powder
kg	= kilogram	km/h	= kilometres per hour

TEMPERATURE

For exact values the formula is:

Fahrenheit to Celsius: subtract 32 from number of °F, then multiply by 5/9.

Celsius to Fahrenheit multiply °C by 9/5 then add 32.

WEED IDENTIFICATION – ONTARIO		www.ontarioweeds.com

Glyphosate and Roundup Ready crops are valuable weed management tools, however:

- The risk of glyphosate resistant weeds will increase if glyphosate is managed improperly.
- In the United States, there are populations of Common Ragweed, Common Waterhemp, Canada Fleabane, Giant Ragweed and Pigweed spp. resistant to glyphosate.
- No new herbicides are currently being developed to replace glyphosate.

There is a tremendous opportunity for Ontario Growers to become leaders in the stewardship of glyphosate. The Ontario Weed Committee has devised the following guidelines for responsible glyphosate use that is intended to minimize the risk of glyphosate resistant weeds.

1) Know What You Have

- Scout fields for weed species and density. If this is beyond your area of interest or expertise then hire a certified crop adviser to do so for you.

2) Develop A Plan

- Once your field has been scouted and you know what weed species you have, sit down with your certified crop adviser and develop a long-term management plan to address your weed spectrum.

Your Plan Should Consider:

“THE SEVEN STEPS OF RESPONSIBLE GLYPHOSATE USE”

1. Use “Roundup Ready” technology in fields where it will have the greatest economic benefit.
2. Rotate “Roundup Ready” crops with conventional or other herbicide tolerant crops as well as rotate herbicides with different modes of action.
3. Always use the full labelled rate of glyphosate.
4. Tank-mix glyphosate with residual herbicides where appropriate.
5. Use cultivation where appropriate.
6. Scout for and report any suspected glyphosate-resistant weeds to 1-877-424-1300.
7. Control and prevent the spread of weed escapes.

For more information on herbicide resistance visit:

www.plant.uoguelph.ca/resistant-weeds

Emergency and First-Aid Procedures for Pesticide Poisoning

For a major spill, a theft or a fire involving a pesticide call the Ministry of the Environment at
1-800-268-6060.

For pesticide poisonings and pesticide injuries call the **Poison Information Centre:**
Toronto 1-800-268-9017
Hearing Assistance (TTY) 1-877-750-2233

PREVENT ACCIDENTS

- **Read the label.** Follow all the precautions the label recommends. Read the First Aid section of the label **BEFORE** you begin to handle any pesticide.
- **Make sure that someone knows** what pesticides you are working with and where you are.
- **Keep a file of labels and product Material Safety Data Sheets (MSDS) for the pesticides you use.** Make sure everyone knows where to find this in case of an emergency.
- **Post emergency numbers near all telephones.**
- **Keep clean water, paper towels, extra gloves and clean coveralls close by** in case you spill pesticide on yourself.

If someone has been working with pesticides and you see any possible symptoms of pesticide poisoning or injury, take emergency action immediately.

IF AN ACCIDENT OR POISONING HAPPENS

- Protect yourself from injury first.
- Stop the exposure to the pesticide. Move the victim away from the contaminated area.
- Check the four basic facts — identify the pesticide, the quantity, the route of entry and time of exposure.
- Call an ambulance or the Poison Information Centre.
- Start first aid. This is not a substitute for professional medical help.
- Provide the label, MSDS sheet or container to emergency personnel at the scene — or take it with you to the hospital. Do not transport pesticide containers in the passenger compartment of the vehicle.

FIRST AID

If a pesticide comes in contact with skin:

- remove all contaminated clothing; wash skin thoroughly with lots of soap and warm water
- dry skin well and cover with clean clothing or other clean material

If pesticide comes in contact with eyes:

- hold eyelids open; wash the eyes with clean running water for 15 minutes or more.

If pesticide was inhaled:

- move the victim to fresh air and loosen tight clothing
- give artificial respiration if the victim is not breathing.

Do not breathe in the exhaled air from the victim — you could also be poisoned.

If a pesticide was swallowed:

- call the Poison Information Centre **IMMEDIATELY.**

Emergency numbers are listed at the front of each Bell telephone directory.

For information, or to obtain copies of this or any other ministry publication please:
call 1-888-466-2372 from within Ontario,
519-826-3700 from outside the province or
OMAFRA's TTY line at 519-826-7402 for the hearing impaired; e-mail your request to
products.omafr@ontario.ca or visit OMAFRA's
website at ontario.ca/omafr.

A complete list of all OMAFRA products and services, and order forms, are available on the website. Orders can be faxed to 519-826-3633 or mailed to ServiceOntario,
1 Stone Road West, Guelph, Ontario N1G 4Y2.

The Ministry of Agriculture, Food and Rural Affairs gratefully acknowledges the financial contribution made by Syngenta Crop Protection Canada Inc. to cover the costs for tabs in this edition of the *Guide to Weed Control*.
